(Received February 23, 1976)

A variety of 7,8-disubstituted 1,4-dimorpholinopyrido[3,4-d]pyridazine derivatives were synthesized in connection with the structure-activity relationships on diuretic activity. 1,4-Dipolar cycloaddition of 4-alkyl- and 4-benzyl-5-ethoxyoxazoles with dimethyl maleate afforded dimethyl 6-alkyl- and 6-benzyl-5-hydroxy-pyridine-3,4-dicarboxylate (3), which were alkylated to give the corresponding 5-alkoxypyridine derivatives (4). The cycloaddition of 5-alkyl- or 5-benzyl-4-phenyloxazole (9) with N-phenylmaleimide gave an adduct (10), heating of which under acidic condition effected dehydration to give 5-alkyl- or 5-benzyl-N,6-diphenylpyridine-3,4-dicarboximide (11). Reactions of 4 and 11 with hydrazine gave pyrido[3,4-d]pyridazine-1,4(2H,3H)-dione derivatives (5 and 12), chlorination of which followed by substitution with morpholine afforded 7-alkyl- and 7-benzyl-8-alkoxy-pyrido[3,4-d]pyridazine derivatives (7a—k) and 8-alkyl- and 8-benzyl-7-phenyl derivatives (14a, 14b, and 14c). Also prepared were 8-methyl-7-substituted phenyl (14d and 15), 8-chloro- (19 and 21), 8-alkoxy-7-phenyl (26a, 26b, and 26c), and 7-methyl-8-phenyl (43) derivatives. Stereochemistry of the adduct (8) obtained by the 1,4-cyclo-addition reaction of 4-phenyloxazole and N-phenylmaleimide was discussed.

In connection with the relationship between the structure and the diuretic activity, we have synthesized a variety of pyrido[3,4-d]pyridazine derivatives, among which 1,4-dimorpholino-7-phenylpyrido[3,4-d]pyridazine (1: DS-511) has proved to be a potent diuretic.^{2,4-6)}

However, derivatives bearing a substituent at the 8-position of the ring have remained unknown with an exception of 8-methoxy-7-methyl-1,4-dimorpholinopyrido[3,4-d]pyridazine (2) which showed a fairly potent diuretic activity. The present paper deals with the chemical modifications of 7-substituted pyrido[3,4-d]pyridazines by introducing substituents at the 8-position.

⁷⁾ T. Matsuo and T. Miki, Yakugaku Zasshi, 92, 703 (1972).

According to Matsuo's method,^{7,8)} a variety of 4-alkyl- and 4-benzyl-5-ethoxyoxazoles were allowed to react with dimethyl maleate to undergo 1,4-dipolar cycloaddition and elimination of ethanol affording dimethyl 6-alkyl- and 6-benzyl-5-hydroxypyridine-3,4-dicarboxylates (3), which were alkylated with alkyl halide to give the corresponding 5-alkoxy derivatives (4). The reaction of 4 with hydrazine afforded 8-alkoxy-7-substituted pyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (5). Chlorination of 5 with phosphorus oxychloride in the presence of N,N-dimethylaniline or α-picoline followed by treatment with cyclic amines yielded the analogues of 2 (7a—k) as listed in Table I.

It was found, however, that the rate of the cycloaddition reaction of 4-aryloxazoles with dimethyl maleate was extremely retarded probably because of the reduced electron density at the diene moiety by the inductive effect of the aryl group. An extensive search to find a more reactive dienophile has finally revealed that N-phenylmaleimide reacts with 4-phenyloxazole more smoothly affording an adduct, N,6-diphenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-3,4-dicarboximide (8), which was led to 1 via the subsequent several steps. 9) By this route, several 7-aryl-8-substituted pyrido[3,4-d]pyridazine derivatives were prepared. Thus, the reaction of 5-alkyl- and 5-benzyl-4-phenyloxazole (9) with N-phenylmaleimide afforded adduct 10, which were dehydrated by heating in dioxane-hydrochloric acid to give 5-alkyland 5-benzyl-N,6-diphenylpyridine-3,4-dicarboximide (11). Treatment of 11 with hydrazine gave 8-alkyl- and 8-benzyl-7-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (12). Chlorination of 12 to give 1,4-dichloro derivative (13) followed by substitution with morpholine yielded 14a-c, in which the 8-position of compound (1) was substituted with methyl, ethyl, and benzyl group respectively. Similarly 7-(p-benzyloxyphenyl)-8-methyl derivative (14d) was prepared from 4-(p-benzyloxyphenyl)-5-methyloxazole (9: $R_1 = p - C_6 H_5 C H_2 O C_6 H_4$, $R_2 = C H_3$). In this case heating of the oxazole with N-phenylmaleimide effected the addition and dehydration simultaneously to give 11. Treatment of 14d with trifluoroacetic acid²⁾ afforded 7-(phydroxyphenyl)-8-methyl derivative (15).

Subsequently, attempts were made to introduce a chlorine, oxygen or nitrogen functional group at the 8-position of 1. The addition reaction of 5-ethoxy-4-phenyloxazole with N-phenylmaleimide followed by heating with hydrochloric acid gave 5-hydroxy-N,6-diphenyl-pyridine-3,4-dicarboximide (16), which was converted to 8-hydroxy-7-phenylpyrido[3,4-d]-pyridazine-1,4-(2H,3H)-dione (17) by treatment with hydrazine. Compound (17) was obtained

also by the reaction of diethyl 5-hydroxy-6-phenylpyridine-3,4-dicarboxylate (22)¹⁰⁾ with hydrazine, although yields in the preparation of 22 was rather unsatisfactory. Chlorination of 17 with phosphorus oxychloride in the presence of α-picoline gave 1,4,8-trichloro-7-phenylpyrido[3,4-d]pyridazine (18), substitution of which with excess morpholine occurred selectively at the 1- and 4-positions affording 8-chloro-1,4-dimorpholino-7-phenylpyrido[3,4-d]pyridazine (19). Likewise 8-chloro-7-methyl derivative (21) was obtained from 8-hydroxy-7-methylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (20).

8-Alkoxy-1,4-dimorpholino-7-phenylpyrido[3,4-d]pyridazine (26a, 26b, and 26c) was prepared from 22 by alkylation, cyclization with hydrazine, chlorination and 1,4-disubstitution with morpholine *via* compounds 23a—c, 24, and 25.

$$\begin{array}{c} R_{2}O \quad O \\ R_{1} & N \\ N & N$$

Chart 3

An attempt to prepare 8-amino derivatives of 1 was undertaken starting with ethyl 3-cyano-6-phenyl-2-pyridone-4-carboxylate (27).¹¹⁾ Nitration of 27 with a mixture of fuming nitric acid and acetic anhydride gave 5-nitro derivative (28), which was chlorinated with phenylphosphonic dichloride to give ethyl 2-chloro-3-cyano-5-nitro-6-phenylpyridine-4-carboxylate (29). Reduction of the nitro group with iron-hydrochloric acid to give 30, followed by dechlorination by catalytic reduction over palladium-charcoal, gave ethyl 5-amino-3-cyano-6-phenylpyridine-4-carboxylate (31). Treatment of 31 with hot conc. sulfuric acid gave 3,4-dicarboximide (32), which afforded 8-amino-7-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (33) by the reaction with hydrazine. However, chlorination of 33 under a variety of conditions was unsuccessful, giving rise to a number of unidentified products.

On the other hand it was found that compound (31) provided a third synthetic route to 17. Thus, hydrolysis of 31 to 3,4-dicarboxylic acid (34) followed by diazotization and hydrolysis gave 5-hydroxy-6-phenylpyridine-3,4-dicarboxylic acid (35). Heating of 35 with

¹⁰⁾ H. Davoll and F.B. Kipping, J. Chem. Soc., 1953, 1395.

acetic anhydride effected dehydration and acetylation to yield 5-acetoxy-6-phenylpyridine-3,4-dicarboxylic anhydride (36), the reaction of which with hydrazine led to 17.

Pharmacological studies in rat revealed that most of the above 8-substituted pyrido[3,4-d]-pyridazine derivatives showed potent diuretic activity. Especially the activities of 14a, 19 and 26a were comparable to that of DS-511 (1).6)

The result led us further to the synthesis of 7-methyl-8-phenyl derivative (43), a position isomer of 14a. 7-Methyl-8-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (41), prepared from methyl 3-cyano-6-methyl-5-phenyl-2-pyridone-4-carboxylate (37)¹²⁾ by a sequence of reactions, *i.e.* chlorination, catalytic reduction, treatment with sulfuric acid, and treatment with hydrazine, by way of compounds 38, 39 and 40, was allowed to react with phosphorus oxychloride to give 1,4-dichloride (42), which was treated with morpholine to yield 43. However, no diuretic activity was observed in 43.

¹²⁾ G.N. Walker and B.N. Weaver, J. Org. Chem., 26, 4441 (1961).

In the aforementioned 1,4-cycloaddition reaction of 4-phenyloxazole and N-phenyl-maleimide, some investigations were undertaken concerning the stereochemistry of the adduct (8). When the reaction was carried out under room temperature in benzene, two isomeric products were isolated. In the nuclear magnetic resonance (NMR) spectrum, the coupling

constant between Ha and Hb (J_{ab}) (Chart 6) and that between Hc and Hd (I_{cd}) for one compound were both zero, while $J_{\mathtt{ab}}$ and $J_{\rm ed}$ for the other were both 4.5 Hz. The result indicates that the configuration of the former is exo (8a) and the latter is endo (8b). The adduct obtained by refluxing 4-phenyloxazole and N-phenylmaleimide during the synthesis of 10⁹⁾ proved to be identical with 8a. In the exo derivative (8a), the trans configuration of C-O bond with respect to Hb and Hc would facilitate the subsequent dehydration to 10. In fact 8a was readily dehydrated to afford 10 on heating in dioxane-hydrochloric acid, while 8b resisted the dehydration under the same condition. Although Diels-Alder reaction generally fol-

lows the "endo rule," it is also known that endo compound is often changed into thermodynamically stable exo compound at an elevated temperature. In our present reaction, it was observed that the exo/endo ratio was increased as the reaction temperature was raised and that a considerable part of 8b was changed into 8a when 8b was refluxed in benzene. The ratio seemed to be affected also by a steric factor: The ratio decreased as the substituent at the 5 position of the 4-phenyloxazole ring was changed from hydrogen to methyl, and to

5-Ethoxy-4-substituted Oxazole—General Procedure: To a stirred suspension of P₂O₅ (79 g) and Hyflo Super-Cel (30 g) in CHCl₃ (400 ml) was added dropwise a solution of ethyl 2-alkyl-N-formylglycinate (0.3 mole) in CHCl₃ (50 ml) at 60—70°. After the mixture was stirred at 60—70° for 2 hr, the cooled mixture was neutralized with NaHCO₃ and the resulting insoluble substance was filtered off. The filtrate was extracted with CHCl₃ and the extract, dried over Na₂SO₄, was evaporated in vacuo. The residue was distilled under reduced pressure to give 4-alkyl-5-ethoxyoxazole. 5-Ethoxy-4-propyloxazole: Yield 32%, bp₂₉ 89—90°, Anal. Calcd. for C₈H₁₃O₂N: C, 61.91; H, 8.44; N, 9.03. Found: C, 61.85; H, 8.26; N, 9.12. 5-Ethoxy-4-sec-butyloxazole: Yield 8%, bp₂₈ 80°, Anal. Calcd. for C₉H₁₅O₂N: C, 63.88; H, 8.94; N, 8.28. Found: C, 63.61; H, 8.80; N, 8.01. 4-Ethyl-, 4-isopropyl-, 17) 4-butyl-, 17) 4-isobutyl-, 4-benzyl-8) and 4-phenyl-5-ethoxyoxazole⁸) were prepared according to the methods described in literatures.

Dimethyl 5-Hydroxy-6-substituted Pyridine-3,4-dicarboxylate (3)—General Procedure: A mixture of 5-ethoxy-4-substituted oxazole and two equimolar dimethyl maleate was heated at 110—120° for 6 hr. Distillation or recrystallization of the reaction mixture gave 3. Dimethyl 5-hydroxy-6-propylpyridine-3,4-dicarboxylate: Yield 59%, mp 89—91°, Anal. Calcd. for C₁₂H₁₈O₅N: C, 56.91; H, 5.97; N, 5.53. Found: C, 56.93; H, 6.06; N, 5.28. Dimethyl 6-sec-butyl-5-hydroxypyridine-3,4-dicarboxylate and dimethyl 6-ethyl-5-hydroxypyridine-3,4-dicarboxylate were used for the subsequent procedure without distillation. Dimethyl 6-isopropyl-,¹⁷⁾ 6-isobutyl-,⁸⁾ and 6-benzyl-5-hydroxypyridine-3,4-dicarboxylate⁸⁾ were prepared according to the methods described in literatures.

¹⁵⁾ All melting points were measured on Kofler-type apparatus (Yanagimoto Co.) and are uncorrected. NMR spectra were measured on Varian T-60 high resolution spectrometer. Thin-layer chromatography (TLC) was carried out on SPOTFILM "Silica Gel f" (Tokyo Kasei Co.).

Dimethyl 5-Alkoxy-6-alkylpyridine-3,4-dicarboxylate (4)—General Procedure: To a solution of 3 (15 g) in anhydrous dimethylformamide (DMF) (100 ml) was added equimolar NaH and the mixture was stirred for 15 min at room temperature. To the mixture was added equimolar alkyl halide and stirring was continued for 1 hr. The mixture was poured into water (500 ml), extracted with CHCl₃. The extract was washed with 5% NaOH and then water, and dried over Na₂SO₄. Removal of the solvent gave crude 4 as a brown oil which was used for the subsequent process without purification.

4-Phenyl-5-substituted Oxazole (9: $R_1 = C_8H_5$)—To a solution of benzylacetophenone¹⁸⁾ (21 g) in CHCl₃ (50 ml) was added Br₂ (1 g) at 50°. When the reaction was initiated, another 15.6 g of Br₂ was added dropwise with stirring under ice cooling. After removal of the solvent *in vacuo* at room temperature, to the residue were added formamide (58 ml) and acetic acid (45 ml). The resulting mixture was heated at 130° for 4 hr. After removal of acetic acid *in vacuo*, the residue was extracted with ether. The extract was washed with aq. NaHCO₃ and dried over Na₂SO₄. Removal of the solvent gave crude 5-benzyl-4-phenyloxazole (21 g) as a brown oil which was used for the subsequent process without purification. 5-Methyl-, 5-ethyl-, and 5-isopropyl-4-phenyloxazole were prepared according to the literature.¹⁹⁾

4-(p-Benzyloxyphenyl)-5-methyloxazole (9: $R_1 = p$ - C_6H_5 CH₂OC₆H₄, $R_2 = CH_3$)— To a solution of p-benzyloxypropiophenone (50 g) in CHCl₃ (200 ml) was added dropwise Br₂ (34 g) stirring at room temperature. Removal of the solvent gave crude p-benzyloxyphenyl-α-bromopropiophenone, which was heated with AcOH (63 ml) and formamide (80 ml) at 150° for 16 hr. After removal of AcOH, the residue was poured into water and extracted with benzene. The extract was washed with 2% KOH and water, and dried over Na₂SO₄. The solvent was evaporated in vacuo and the residue was refluxed with hexane (700 ml) for 1 hr. Hexane layer was separated by decantation, decolorized with charcoal and cooled to give 13 g (24%) of 9 ($R_1 = p$ - C_6H_5 -CH₂OC₆H₄, R_2 =CH₃) as colorless crystals, mp 67—68°. Anal. Calcd. for $C_{17}H_{15}O_2N$: C, 76.96; H, 5.70; N, 5.28. Found: C, 77.19; H, 5.69; N, 5.34.

5-Alkyl (or Benzyl)-N,6-diphenylpyridine-3,4-dicarboximide (11: $R_1 = C_6H_5$) (Table IV)—General Procedure: A mixture of 5-alkyl (or benzyl)-4-phenyloxazole (9: $R_1 = C_6H_5$), (10 g) and equimolar N-phenylmaleimide was heated at 130—140° for 12 hr to give crude 5-alkyl (or benzyl)-N,6-diphenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-3,4-dicarboximide (10: $R_1 = C_6H_5$), which, without purification, was heated with a mixture of dioxane (40 ml) and 5 drops of conc. HCl at 110° for 1 hr. After evaporation in vacuo, the residue was recrystallized from EtOH to give 11 ($R_1 = C_6H_5$).

6-(p-Benzyloxyphenyl)-5-methyl-N-phenylpyridine-3,4-dicarboximide (11: $R_1=p-C_6H_5CH_2OC_6H_4$) (Table IV)—A mixture of 4-(p-benzyloxyphenyl)-5-methyloxazole (3 g) and equimolar N-phenylmaleimide was heated at 120—130° for 6 hr. The resulting solid was recrystallized from AcOEt to give 11 ($R_1=p-C_6H_5CH_2-OC_6H_4$).

5-Hydroxy-N,6-diphenylpyridine-3,4-dicarboximide (16)—A mixture of 5-ethoxy-4-phenyloxazole (9: $R_1=C_6H_5$, $R_2=OC_2H_5$) (6.3 g) and N-phenylmaleimide was heated at 130—140° for 4 hr and then dissolved in hot EtOH. After cooling, the resulting precipitates were removed by filtration. To the filtrate was added

10 drops of conc. HCl, and the mixture was refluxed for 1 hr. After cooling, the resulting precipitate was collected by filtration and recrystallized from AcOEt to give 2.6 g (25%) of 16, mp 225—228°. Anal. Calcd. for $C_{19}H_{12}O_3N_2$: C, 72.14; H, 3.82; N, 8.86. Found: C, 71.95; H, 3.71; N, 8.52.

Diethyl 5-Methoxy-6-phenylpyridine-3,4-dicarboxylate Hydrochloride (23a)—To a solution of diethyl 5-hydroxy-6-phenylpyridine-3,4-dicarboxylate hydrochloride (22)¹⁰⁾ (4.2 g) in anhydrous DMF (40 ml) was added NaH (50% in oil: 1.4 g) with stirring under cooling. After the addition was completed, the stirring was continued for 30 min, and then methyl iodide (5 ml) was added to the mixture. After stirring for 1 hr, the resulting solution was poured into water (300 ml), made alkaline (pH 9) with 10% aq. NaOH, and extracted with benzene. The extract was dried over Na₂SO₄ and evaporated *in vacuo*. The residue was dissolved in ether, and the solution was acidified with EtOH-HCl. After cooling in an ice bath, the resulting precipitate was filtered and recrystallized from benzene-ether to give 3.3 g of 23a as colorless needles, mp 86—98°. *Anal.* Calcd. for $C_{12}H_{19}O_5N\cdot HCl: C, 59.10; H, 5.51; N, 3.83$. Found: C, 59.09; H, 5.26; N, 3.85.

Diethyl 5-Ethoxy-6-phenylpyridine-3,4-dicarboxylate Hydrobromide (23b)—To a solution of 22 (5 g) in anhydrous DMF (30 ml) was added NaH (50% in oil: 1.6 g) with stirring and cooling. After the addition was completed, the stirring was continued for 10 min, ethyl iodide (4.5 g) was added to the mixture and the whole mixture was heated at 80° for 1 hr with stirring. After cooling, the resulting solution was poured into water (300 ml), made alkaline (pH 9) with 10% aq. NaOH, and extracted with AcOEt. The extract was washed with water, dried over Na₂SO₄ and evaporated in vacuo. The residue was dissolved in ether, and to the solution was added 30% HBr-AcOH (8 ml). The resulting precipitate was filtered, washed with ether and recrystallized from EtOH-ether to give 4.6 g (76%) of 23b as colorless needles, mp 143—152°. Anal. Calcd. for $C_{19}H_{21}O_5N \cdot HBr: C$, 53.78; H, 5.23; N, 3.30. Found: C, 53.69; H, 5.26; N, 3.35.

Diethyl 6-Phenyl-5-propoxypyridine-3,4-dicarboxylate Hydrobromide (23c)—To a solution of 22 (5 g) in anhydrous DMF (30 ml) was added NaH (50% in oil: 1.6 g) with stirring and cooling. After the addition was completed, the stirring was continued for 10 min, and then propyl iodide (4.9 g) was added to the mixture. The subsequent procedures similar to those described for 23b afforded 5.1 g (81%) of 23c as colorless prisms, mp 148—154°. Anal. Calcd. for $C_{20}H_{23}O_5N \cdot HBr$: C, 54.80; H, 5.52; N, 3.20. Found: C, 54.77; H, 5.47; N, 3.16.

Ethyl 3-Cyano-5-nitro-6-phenyl-2-pyridone-4-carboxylate (28)—A mixture of fuming nitric acid (d=1.52) (15.4 ml) and acetic anhydride (14 ml), which was prepared under cooling, was added to a well-stirred suspension of ethyl 3-cyano-6-phenyl-2-pyridone-4-carboxylate (27) (48 g) in acetic anhydride (100 ml) at such a rate that the temperature was kept between 40° and 50°. After the addition was completed, the mixture was stirred for another 30 min at room temperature. The resulting mixture was poured into a mixture of cracked ice (300 g) and water (100 ml) and stirred for 4 hr. After standing overnight, the resulting light yellow precipitate was filtered, thoroughly washed with water and dried by suction. The resulting crystals were washed with 30 ml of EtOH-ether (1: 2) and then with ether to give 34.4 g (61.5%) of 28, mp 219—222°. Anal. Calcd. for $C_{15}H_{11}O_{5}N_{3}$: C, 57.51; H, 3.54; N, 13.42. Found: C, 57.52; H, 3.26; N, 13.52.

Ethyl 2-Chloro-3-cyano-5-nitro-6-phenylpyridine-4-carboxylate (29) — A mixture of 28 (20 g) and phenylphosphonic dichloride (30 ml) was heated at 170—180° for 2 hr. After cooling, the resulting mixture was poured into ice water to give crystals which were filtered and recrystallized from MeOH to give 19.6 g (93%) of 29 as colorless tablets, mp 110—112°. Anal. Calcd. for $C_{15}H_{10}O_4N_3Cl$: C, 54.31; H, 3.04; N, 12.67. Found: C, 54.18; H, 2.99; N, 12.81.

Ethyl 5-Amino-2-chloro-3-cyano-6-phenylpyridine-4-carboxylate (30)—To a mixture of iron powder (15 g), 29 (10 g) and EtOH (100 ml), vigorously stirred and warmed at 60°, was added dropwise conc. HCl (65.6 ml). During the addition, the mixture started to reflux vigorously. After the addition was completed, the mixture was stirred for 15 min at 60°, 2 hr at room temperature, and then 15 min cooling with ice. Resulting precipitate was filtered, washed with water and recrystallized from EtOH to give 30 (7.9 g: 87%) as yellow needles, mp 147—149°. Anal. Calcd. for $C_{15}H_{12}O_2N_3Cl$: C, 59.71; H, 4.01; N, 13.93. Found: C, 59.71; H, 3.89; N, 14.00.

Ethyl 5-Amino-3-cyano-6-phenylpyridine-4-carboxylate (31)——A mixture of 30 (10 g), 5% Pd-C (10 g), triethylamine (15 ml) and AcOEt (200 ml) was hydrogenated under atmospheric pressure at room temperature. When the theoretical amount of hydrogen was absorbed, the catalyst was filtered off and the filtrate was evaporated *in vacuo*. To the residue was added water (200 ml) and the resulting crystals were filtered. Recrystallization from MeOH gave 31 (7.4 g: 84%) as yellow needles, mp 136—138°. *Anal.* Calcd. for C₁₅-H₁₃O₂N₃: C, 67.40; H, 4.90; N, 15.72. Found: C, 67.43; H, 4.91; N, 15.41.

5-Amino-6-phenylpyridine-3,4-dicarboximide (32)—A mixture of 31 (1 g) and conc. H_2SO_4 (1.5 ml) was heated at 100—110° for 1 hr. After cooling, the resulting solution was poured into ice water and adjusted to pH 3 with dil. NaOH and aq. K_2CO_3 . The resulting precipitate was filtered and recrystallized from EtOH to give 32 (0.8 g: 91%) as orange yellow needles, mp 221—224°. Anal. Calcd. for $C_{13}H_9O_2N_3$: C, 65.26; H, 3.79; N, 17.57. Found: C, 65.02; H, 3.80; N, 17.73.

5-Amino-6-phenylpyridine-3,4-dicarboxylic Acid (34)——A mixture of 31 (5 g) and conc. HCl (50 ml) was refluxed for 15 hr. After removal of the solvent, water (50 ml) was added to the residue. The resulting crystals were filtered, washed with water and recrystallized from 50% EtOH to give 34 (4.5 g: 93%) as pale

yellow powder, mp 120—123°. Anal. Calcd. for $C_{13}H_{10}O_4N_2$: C, 60.46; H, 3.90; N, 10.85. Found: C, 59.97; H, 3.77; N, 10.69.

5-Hydroxy-6-phenylpyridine-3,4-dicarboxylic Acid (35)—To a solution of 34 (2 g) in 10% HCl (34 ml) was added dropwise a solution of NaNO₂ (1.9 g) in water (10 ml) with stirring at 90°. After the addition was completed, the stirring was continued for further 15 min. After cooling, water was added to the residue and the resulting crystals were filtered to give 35 (1.4 g: 70%) as pale yellow powder, mp 212—222° (decomp.). Anal. Calcd. for $C_{13}H_9O_5N$: C, 60.23; H, 3.50; N, 5.40. Found: C, 59.74; H, 3.49; N, 5.29. 20-B

5-Acetoxy-6-phenylpyridine-3,4-dicarboxylic Anhydride (36)——A mixture of 35 (1.2 g) and Ac_2O (20 ml) was heated at 130—140° for 3 hr. After evaporation of Ac_2O in vacuo, the residue was recrystallized from ether to give 0.7 g (53%) of 36 as pale yellow needles, mp 180—187° (decomp.). Anal. Calcd. for $C_{15}H_{19}O_5$ -N: C, 63.61; H, 3.20; N, 4.59. Found: C, 63.25; H, 3.09; N, 4.92.

Methyl 2-Chloro-3-cyano-6-methyl-5-phenylpyridine-4-carboxylate (38)——A mixture of methyl 3-cyano-6-methyl-5-phenyl-2-pyridone-4-carboxylate (37: 6 g)¹²⁾ and phenylphosphonic dichloride (8.5 g) was heated at $180-190^{\circ}$ for 2 hr. After cooling, the mixture was poured into ice water. The resulting precipitate was filtered and recrystallized from MeOH to give 5.7 g (88%) of 38 as colorless tablets, mp 99—100°. Anal. Calcd. fcr $C_{15}H_{11}O_2N_2Cl$: C, 62.83; H, 3.87; N, 9.77; Cl, 12.37. Found: C, 63.16; H, 3.64; N, 9.61; Cl, 12.36.

Methyl 3-Cyano-6-methyl-5-phenylpyridine-4-carboxylate (39)—A solution of 38 (2 g) and triethylamine (1 g) in MeOH (40 ml) was hydrogenated over 5% Pd-C (200 mg) under atmospheric pressure at room temperature. After absorption of hydrogen ceased, the catalyst was filtered and the filtrate was evaporated to dryness in vacuo. The residue was extracted with AcOEt and the extract was dried over Na₂SO₄. After removal of the solvent, the residue was cooled on ice to give 1.4 g (80%) of 39, mp 39—40°. Anal. Calcd. for $C_{15}H_{12}O_2N_2$: C, 71.41; H, 4.80; N, 11.11. Found: C, 71.46; H, 4.78; N, 10.63.

6-Methyl-5-phenylpyridine-3,4-dicarboximide (40)—A mixture of 39 (2.75 g) and conc. H_2SO_4 (3 ml) was heated at 100° for 2 hr. After cooling, water was added to the mixture. The resulting crystals were filtered and recrystallized from EtOH to give 2.2 g of 40 as pale yellow needles, mp 200—206° (decomp.). Anal. Calcd. for $C_{14}H_{10}O_2N_2$: C, 70.58; H, 4.23; N, 11.76. Found: C, 70.44; H, 3.90; N, 11.55.

7,8-Disubstituted Pyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (5 and 12) (Table V)—a) To a solution of 4 (8 g) in EtOH (150 ml) was added 80% $N_2H_4\cdot H_2O$ (16 g), and the mixture was refluxed for 7 hr. After cooling, the resulting precipitate (hydrazinium salt of 5) was collected by filtration and suspended in water (150 ml). The suspension was adjusted to pH 1—2 with 10% HCl and stirred for 2 hr. The resulting crystals were filtered, washed and dried to give 5. Compounds 5 obtained in pure form are listed in Table V. 5 (R_1 =C H_3 , R_2 =C H_3), 5 (R_1 =C H_3), 7 (R_1 =C H_3), 8 (R_1 =C H_3) were used for the subsequent reaction without purification.

b) A mixture of 11 (5 g) and 80% $N_2H_4\cdot H_2O$ (35 ml) was heated at 150° for 2 hr. After removal of the excess $N_2H_4\cdot H_2O$, EtOH was added to the residue. The resulting crystals were filtered and suspended in water. The suspension was adjusted to pH 1—2 with 10% HCl and stirred for 2 hr. The resulting crystals were filtered, washed and dried to give 12.

8-Hydroxy-7-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (17) (Table V)—General Procedure: A mixture of 16, 22, or 36 (0.6 g) and 80% N₂H₄·H₂O (10 ml) was heated at 120° for 1 hr. After removal of excess N₂H₄·H₂O in vacuo, EtOH was added to the residue. The resulting crystals (hydrazinium salt of 17) were filtered and suspended in water. The suspension was stirred and adjusted to pH 1—2 with 10% aq. HCl. After stirring was continued for 1 hr, the resulting crystals were filtered to give 17 as pale yellow powder.

8-Alkoxy-7-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (24) (Table V)—A mixture of 23 (1.5 g), 80% $N_2H_4\cdot H_2O$ (3 ml) and EtOH (30 ml) was refluxed for 4 hr. After cooling, the resulting crystals were filtered to give hydrazinium salt of 24 as yellow needles, which was suspended in water (15 ml) and the suspension was acidified with AcOH. After stirring for 1 hr, the resulting crystals were filtered to give 24 as pale yellow powder.

8-Amino-7-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (33) (Table V)——A mixture of 32 (1 g) and 80% N₂H₄·H₂O (20 ml) was heated at 140° for 1 hr. After removal of excess N₂H₄·H₂O in vacuo, water was added to the residue. The resulting suspension was acidified with 10% HCl and adjusted to pH 1. The mixture was filtered and the filtrate was adjusted to pH 5 with dil. NH₄OH. The resulting precipitate was filtered, washed with water and dried to give 33 as yellow powder.

7-Methyl-8-phenylpyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (41) (Table V)—A mixture of 40 (2 g), AcOH (20 ml) and 80% N₂H₄·H₂O (4 ml) was refluxed for 30 min. After cooling, the mixture was diluted with water. The resulting precipitate was filtered, washed with water and dried by succion to give 41 as pale yellow powder.

7,8-Disubstituted-1,4-bis-(substituted amino)pyrido[3,4-d]pyridazine (7, 14, 26, and 43) (Table I)—General Procedure: A mixture of 5, 12, 24, or 41 (1 g), POCl₃ (15 ml) and N,N-dimethylaniline or α-picoline (1.5 g) was heated at 110—120° for 3 hr. The excess POCl₃ was evaporated *in vacuo* and the residue was poured into ice water. The resulting crystals were filtered to give crude 1,4-dichloro-7,8-disubstituted pyrido[3,4-d]pyridazine (6, 13, 25, and 42), which, without purification, was refluxed with morpholine or piperidine (10

Table V. 7,8-Disubstituted Pyrido[3,4-d]pyridazine-1,4(2H,3H)-diones

ml) for 4 hr. After removal of the excess amine, water was added to the residue. The filtration and recrystallization of the resulting crystals gave 7, 14, 26, or 43.

7-(p-Hydroxyphenyl)-8-methyl-1,4-dimorpholinopyrido[3,4-d]pyridazine (15) (Table I)——A mixture of 7-(p-benzyloxyphenyl)-8-methyl-1,4-dimorpholinopyrido[3,4-d]pyridazine (14d, 2g) and trifluoroacetic acid (20 ml) was refluxed for 40 min. The excess trifluoroacetic acid was removed by evaporation in vacuo and subsequently by azeotropic distillation with benzene. The residual oil was neutralized with aq. NaHCO₃ and extracted with CHCl₃. The extract was dried over anhydrous Na₂SO₄ and evaporated to dryness. Recrystallization of the residue from MeOH gave 15 as yellow prisms.

8-Chloro-1,4-dimorpholino-7-substituted Pyrido[3,4-d]pyridazine (19 and 21) (Table I)——A mixture of 17 (0.4 g), POCl₃ (6 ml) and α-picoline (0.4 ml) was heated at 120° for 8 hr. After removal of the excess POCl₃, the residue was poured into ice water and the resulting crystals were filtered and purified by column chromatography on silica gel eluted with benzene-acetone (10: 1) to give 1,4,8-trichloro-7-phenylpyrido[3,4-d]-pyridazine (18). 18 was heated with morpholine (8 ml) at 140° for 3 hr. After removal of excess morpholine by evaporation in vacuo, water was added to the residue. The resulting crystals were filtered and recrystal-lized from EtOH to give 8-chloro-1,4-dimorpholino-7-phenylpyrido[3,4-d]pyridazine (19) as yellow needles. 8-Chloro-7-methyl-1,4-dimorpholinopyrido[3,4-d]pyridazine (21) was prepared from 8-hydroxy-7-methyl-pyrido[3,4-d]pyridazine-1,4(2H,3H)-dione (20)⁷⁾ by the similar procedure.

Reactions of 4-Phenyloxazole Derivatives with N-Phenylmaleimide (Table II and Table III)—a) 4-Phenyloxazole (9: $R_1=C_6H_5$, $R_2=H$) (1 g) and N-phenylmaleimide (1.4 g) were reacted under the conditions shown in Table II. In the cases that benzene (20 ml) was used as the solvent, N,6-diphenyl-2,3,4,5-tetra-hydro-2,5-epoxypyridine-exo-3,4-dicarboximide (8a) was precipitated as colorless needles after cooling. The filtrate was evaporated in vacuo and the residue was purified by column chromatography on silica gel eluted with benzene-acetone (20: 1) to give N,6-diphenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-endo-3,4-dicarboximide (8b) as colorless prisms. In the case that the reaction was carried out without solvent, addition of ether

to the reaction mixture afforded the crystals of 8a, 8b being observed only trace quantities on TLC of the filtrate.

- b) 5-Methyl-4-phenyloxazole (8: $R_1=C_6H_5$, $R_2=CH_3$) (1 g), N-phenylmaleimide (1.25 g) and benzene (10 ml) were reacted under the conditions shown in Table II. After removal of the solvent, the residue was purified by column chromatography on silica gel eluted with benzene-acetone (15: 1) to give 5-methyl-N,6-diphenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-exo-3,4-dicarboximide as colorless crystals. endo-Adduct could not be isolated in a pure form. The yields in Table II were calculated by integral intensity of the methyl groups in NMR (CH₃ of oxazole: 7.49 τ , CH₃ of endo-adduct: 7.85 τ , CH₃ of exo-adduct: 7.98 τ).
- c) 5-Isopropyl-4-phenyloxazole (8: $R_1=C_6H_5$, $R_2=CH(CH_3)_2$) (1 g) and N-phenylmaleimide (1 g) were allowed to react under the conditions shown in Table II. The reaction mixture was purified by column chromatography on silica gel eluted with benzene–acetone (20: 1) to give 5-isopropyl-N,6-diphenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-exo-3,4-dicarboximide as colorless prisms. The endo-adduct could not be crystallized. No addition reaction proceeded when the reaction was carried out in benzene.
- d) A mixture of 5-ethyl-4-phenyloxazole (1 g), N-phenylmaleimide (1.1 g) and benzene (10 ml) was refluxed for 7 hr. After removal of the solvent, EtOH was added to the residue and cooled. The resulting crystals were filtered and recrystallized from EtOH to give 0.5 g (24%) of 5-ethyl-6-phenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-exo-3,4-dicarboximide as colorless prisms.
- e) A mixture of 5-benzyl-4-phenyloxazole (17 g) and N-phenylmaleimide (12.5 g) was heated at 130—140° for 4 hr. The resulting mixture was dissolved in CHCl₃ (150 ml). Ether (500 ml) was added to the solution and the resulting solution was allowed to stand at room temperature to precipitate 5-benzyl-6-phenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-exo-3,4-dicarboximide (4.3 g: 15%) as the first crop. The second crop was a mixture of exo-adduct and endo-adduct, and finally 5-benzyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-endo-3,4-dicarboximide (3 g: 10%) was precipitated. The respective recrystallization from AcOEt gave pure exo-adduct as colorless prisms and endo-adduct as colorless granules.
- f) A mixture of 5-ethoxy-4-phenyloxazole (5 g) and N-phenylmaleimide (4.8 g) was heated at 140° for 4 hr and dissolved in hot EtoH. After cooling, the resulting precipitate was filtered and recrystallized from EtoH to give 5-ethoxy-6-phenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-endo-3,4-dicarboximide (1.5 g: 16%) as colorless needles. The filtrate was evaporated in vacuo and the residue was purified by column chromatography on silica gel to give 5-ethoxy-6-phenyl-2,3,4,5-tetrahydro-2,5-epoxypyridine-exo-3,4-dicarboximide (6.2 g: 65%) as an oil.
