

The Stereochemistry of Substitutions at Germanium

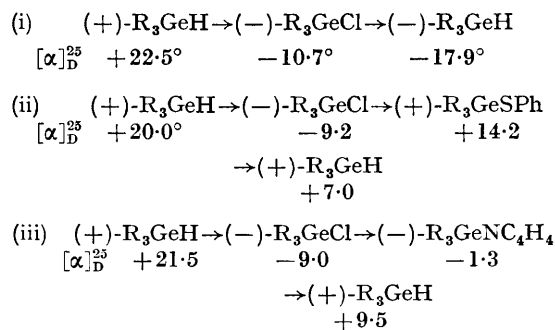

By C. EABORN,* R. E. E. HILL, and P. SIMPSON

(School of Molecular Sciences, University of Sussex, Brighton, BN1 9QJ)

OPTICALLY ACTIVE germanium compounds, first prepared some five years ago,^{1,2} were shown to undergo some reactions with a fair degree of stereospecificity.¹⁻⁴ We have now examined a range of reactions of optically active ethyl-(1-naphthyl)-phenylgermanium compounds, R_3GeX , with nucleophilic reagents, and the results are summarized in the Table. The stereochemical assignments are based on Brewster's rules⁵ (which seem to apply well to germanium and silicon compounds^{3,6,7}) and lead to internal consistency.

Loss of optical activity seems generally to be greater than in comparable reactions of methyl-(1-naphthyl)phenylsilicon compounds.⁸ However, the Walden cycle (i) occurs with 90%, the cycle

(ii) with 68%, and the cycle (iii) with 72% overall stereospecificity:

Some loss of optical activity is not surprising, since the chloride $(-)-R_3GeCl$ is known to racemize fairly readily in solution,⁹ as is the closely related chloride $Me-(1-C_{10}H_7)PhGeCl$,¹⁰ and the hydride

while retention occurs with the poorer leaving groups OMe, menthoxide, and $OGeR_3$. In cases in which the corresponding reactions for $Me-(1-C_{10}H_7)PhSiX$ compounds have also been studied,

Reactions of optically active Et-(1-C₁₀H₇)PhGeX Compounds^a

Reaction No.	R ₃ GeX	[α] _D ²⁵⁰	Reagents, etc.	Product(s)	[α] _D ²⁵⁰	Predominant stereochemistry
(1)	R ₃ GeCl	-8.2	MeOH, Pr ¹ ₂ NH	R ₃ GeOMe	-4.9	Inv.
(2)	R ₃ GeCl	-9.0	PhSH, Pr ¹ ₂ NH	R ₃ GeSPh	+21.5	Inv.
(3)	R ₃ GeCl	-7.0	H ₂ S, Et ₃ N	R ₃ GeSGeR ₃	+29.9	Inv. ^b
(4)	R ₃ GeCl	-10.7	LiAlH ₄ , Et ₂ O	R ₃ GeH	-17.2	Inv. ^c
(5)	R ₃ GeCl	-9.0	Bu ⁿ Li, Et ₂ O	R ₃ GeBu ⁿ	+6.3	Inv.
(6)	R ₃ GeCl	-9.0	MeLi, Et ₂ O	R ₃ GeMe	+1.6	Inv.
(7)	R ₃ GeCl	-9.0	N-lithiopyrrole, Et ₂ O	R ₄ GeNC ₄ H ₄	-1.3	Inv.
(8)	R ₃ GeOMe	-4.9	LiAlH ₄ , Et ₂ O	R ₃ GeH	-6.0	Ret.
(9)	R ₃ GeOMe	+3.6	Bu ⁿ Li, Et ₂ O	R ₃ GeBu ⁿ	-2.7	Ret.
(10)	R ₃ GeOMen ^d	-63.8	LiAlH ₄ , Et ₂ O	R ₃ GeH	+22.6	Ret.
(11)	R ₃ GeOMen ^d	-63.8	Bu ⁿ Li, Et ₂ O	R ₃ GeBu ⁿ	-5.6	Ret.
(12)	R ₃ GeSPh	+14.2	LiAlH ₄ , Et ₂ O	R ₃ GeH	+7.0	Inv.
(13)	R ₃ GeSGeR ₃	+21.5	Bu ⁿ Li, Et ₂ O (2 hr.)	R ₃ GeBu ⁿ , R ₃ GeSGeR ₃	-2.2 +	Inv. ^e
(14)	R ₃ GeSGeR ₃	+21.5	Bu ⁿ Li, Et ₂ O (24 hr.)	R ₃ GeBu ⁿ	0.0	
(15)	R ₃ GeNC ₄ H ₄	-1.3	LiAlH ₄ , Et ₂ O	R ₃ GeH	+9.5	Inv.
(16)	R ₃ GeNC ₄ H ₄ (1) (2)	-1.3	Bu ⁿ Li, Et ₂ O	R ₃ GeBu ⁿ	-3.5	Inv.
(17)	R ₃ GeO ₂ CGeR ₃ (1) (2)	-10.0	LiAlH ₄ , Et ₂ O	R ₃ GeH, R ₃ GeCH ₂ OH	-2.8 +2.0	Inv. (Ge-1) Ret. (Ge-2)
(18)	R ₃ Ge[OGeR ₃ -] (±)	+1.7	LiAlH ₄ , Et ₂ O	R ₃ GeH, R ₃ GeOGeR ₃	+1.6	Ret. (Ge-1)

^a Rotations were measured in benzene. ^b Inversion occurs at both germanium centres. ^c Cf. ref. 4. ^d Refers to the $(-)$ -menthoxide. ^e Not isolated. ^f Inversion occurs at one germanium centre and retention at the other.

$(+)-R_3GeH$ racemizes readily (without significant decomposition) when heated at 100°.⁹

It will be seen from the Table that in the reactions so far studied inversion apparently occurs with the relatively good leaving groups (cf. ref. 8) Cl, SPh, SGeR₃, NC₄H₄, and O₂CGeR₃,

viz., reactions (1), (3)—(6), (8)—(11), and (18),^{8,11} the predominant stereochemical consequences are the same as for the germanium compounds.

We thank the S.R.C. for support and for a studentship (to R.E.E.H.).
