

Structure and Absolute Stereochemistry of Everninosose, a Non-reducing Sugar obtained on Hydrolysis of Everninomicin D¹

By ASHIT K. GANGULY,* OLGA Z. SARRE, and JAMES MORTON

(Natural Products Research Department, Schering Corporation, Bloomfield, New Jersey 07003)

Summary Everninosose, a hydrolysis product of everninomicin B and D, has been shown to possess structure (I).

EVERNINOMICIN D on hydrolysis gave a mixture of products from which everninosose was isolated² by Herzog and his collaborators. Everninosose (I), C₁₄H₂₆O₁₀,[†] m.p. 200—201°, [α]_D - 74.1° (water) is a non-reducing sugar, consumes two moles of periodic acid, and does not form a trityl derivative. The n.m.r. spectrum (pyridine) of everninosose showed the presence of three methoxy-groups at δ 3.35, 3.5, and 3.65 and two anomeric protons at δ 5.25 (1H; *J*_{W/2} ca. 1.5 Hz) and δ 5.7 (1H; *J* 2.5 Hz). Everninosose forms a tetra-acetate (II),[‡] C₂₂H₃₄O₁₄, m.p. 150—151°, [α]_D - 77.1° which does not show the presence of any hydroxy-group in the i.r. spectrum; the n.m.r. spectrum shows the presence of three methoxy-groups, four acetate methyls, and two anomeric protons. The mass spectrum of the tetra-*O*-trimethylsilyl ether of everninosose showed a strong *M* - 15 peak at *m/e* 627 besides a small molecular-ion peak at *m/e* 642. Other prominent peaks were at *m/e* 335 and

291 [ions (III) and (IV)]. Further fragmentation of ions (III) and (IV) followed the expected pattern as outlined by DeJongh *et al.*³

The above mass spectral fragmentation, together with the fact that everninosose is a non-reducing sugar, clearly indicated that everninosose was made up of a dimethoxy-hexose and a monomethoxy-pentose and that they were linked through their anomeric hydroxy-groups.

On prolonged heating with aqueous acid, everninosose was hydrolysed into a mixture of two monosaccharides which were separated using preparative t.l.c., and their structures have been shown to be 2,6-di-*O*-methyl-D-mannose⁴ (V) and 2-*O*-methyl-L-lyxose (VI) in the following way.

Compound (V), syrup, [α]_D + 7.9° (water; 72 hr.) is a reducing sugar (anomeric proton at δ 5.3; *J* 2 Hz) and contains two methoxy-groups. It forms a triacetate (VII) which sublimed at 85°/0.2 mm. Hg, as syrup, C₁₄H₂₂O₉, [α]_D + 55.7°. The n.m.r. spectrum of (VII) agreed with that published recently for triacetoxycuramicose.⁴ The mass spectrum of the di-*n*-propyl mercaptal of (V), C₁₄H₃₀O₅S₂, m.p. 50°, [α]_D - 24.01° showed, in addition to a molecular-ion peak at *m/e* 342, prominent peaks at *m/e* 267 (VIII), 235 (IX), 205 (X), 207 (XI), 179 (XII), and 147 (XIII). The methyl glycoside of compound (V) on methylation⁵ yielded (XIV), which on hydrolysis gave (XV), syrup, C₁₀H₂₀O₆, [α]_D + 2.3° (water; 24 hr.) identical with an authentic sample of 2,3,4,6-tetra-*O*-methyl-D-mannose,[§] [α]_D + 2.3° (water; 24 hr.).

Compound (VI) crystallized from acetone, C₈H₁₆O₅, m.p. 122°, [α]_D + 6.2° (water; 72 hr.). It formed a di-*n*-propyl mercaptal, C₁₂H₂₆O₄S₂, m.p. 49°, [α]_D + 19.5°, the mass spectrum of which showed the molecular-ion peak at *m/e* 298 and also peaks at *m/e* 223 (XVI), 191 (XVII), 207 (XI), 205 (X), 135 (XVIII), and 103 (XIX), confirming⁶ that compound (VI) was a 2-methoxypentose.

Compound (VI) formed a triacetate which sublimed at 80°/0.1 mm. Hg as a syrup, C₁₂H₁₈O₈, [α]_D - 10.5°. Besides three acetyl methyl groups, the n.m.r. spectrum (100 MHz) of the triacetate (XX) in benzene solution showed signals at δ 3.88 (1H; *q*; *J* 11.5 and 4.5 Hz; 5e-H), δ 3.69 (1H; *q*; *J* 11.5 and 7.0 Hz; 5a-H), δ 5.40 (1H; octet; *J* 4.5, 7.0, and 8.0 Hz; 4-H), 5.52 (1H; *q*; *J* 8.0 and 2.9 Hz; 3-H) 3.60 (1H; *q*; *J* 2.9 and 4.2 Hz; 2-H), and 6.29 (1H; *d*; *J* 4.2 Hz; 1-H). The above chemical shifts and coupling-constant values were obtained using spin-spin-decoupling experiments. From the above data one would conclude that compound (VI) was 2-methoxy-lyxose. To prove the gross structure and particularly its absolute stereochemistry, the methyl glycoside (XXI) was methylated⁶ to (XXII) and then hydrolysed to (XXIII), sublimed at 60°/0.2 mm. Hg as syrup, C₈H₁₆O₅, [α]_D + 12.4° which was identical with an authentic sample[§] of 2,3,4-trimethoxy-D-lyxose (XXIIIa) except for the opposite sign of rotation [α]_D - 21.6°. In

[†] Satisfactory elementary analyses were obtained for all new compounds; unless otherwise noted, i.r. spectra were recorded in chloroform solution and n.m.r. spectra were taken at 60 MHz in CDCl₃ with internal SiMe₄ standard; optical rotations were measured in chloroform solution at 25°.

[‡] We thank Dr. H. Reimann for making these observations.

[§] Authentic samples of (XV) and (XXIIIa) were prepared from D-mannose and D-lyxose, respectively, using conventional methods.

the n.m.r. spectrum of (XX) the higher coupling constants (J 4.2 Hz) of 1-H and 2-H and comparatively lower coupling constants of 4-H and 5-H (J 7.0 Hz) and 3-H and 4-H (J 8.0 Hz) suggests⁷ that 2-*O*-methyl-1,3,4-triacetoxy- α -L-lyxose (XX) exists in a conformational equilibrium between $1C_4$ and $1C_1$ conformations approximately in the ratio of 3:2.

The absolute configurations of (V) and (VI) were further confirmed by c.d. measurements⁸ of the cuprammonium complex of their methyl glycosides. Thus having had established the structure and absolute stereochemistry of (V) and (VI), it remained to prove the stereochemistry of the anomeric linkages in everninose (I). Everninose on methylation⁵ yielded (XXIV), syrup, $C_{18}H_{34}O_{10}$, $[M]_D -356^\circ$. To apply Klyne's rule⁹ we have prepared compounds (XXV)—(XXVIII) in the conventional way and determined their molecular rotation values (Table).

Assuming that Klyne's rule is valid in a structure like everninose, it follows from these results that the structure and absolute stereochemistry of everninose should be

represented as (I). In trehalose (XXIX), the only other example of a naturally occurring disaccharide of this group, Klyne's rule has been successfully applied¹⁰ to determine its stereochemistry.

TABLE

	Compound	$[M]_D$
(XXV)	Methyl 2,3,4,6-tetra- <i>O</i> -methyl- β -D-mannoside	-218°
(XXVI)	Methyl 2,3,4,6-tetra- <i>O</i> -methyl- α -D-mannoside	+132°
(XXVII)	Methyl 2,3,4-tri- <i>O</i> -methyl- β -D-lyxoside	-176°
(XXVIII)	Methyl 2,3,4-tri- <i>O</i> -methyl- α -D-lyxoside	+76°
(XXIV)	Tetra- <i>O</i> -methyl ether of everninose	-356°

We thank Dr. R. D. Guthrie and Miss S. T. K. Bhukhari of the University of Sussex, Brighton, for c.d. measurements on the cuprammonium complexes.
