

Synthesis of 3,7-Anhydro-octose Derivatives Related to Octosyl Acids

By K. ANZAI* and T. SAITA

(The Institute of Physical and Chemical Research, Wako-shi, Saitama, Japan 351)

Summary Some derivatives of 3,7-anhydro-6-deoxy-D-glycero-D-allo-octofuranosyluronic acid, the sugar portion of octosyl acids A and B, have been synthesized.

As an approach to the synthesis of octosyl acids A and B (1) and (2),¹ which were isolated from the fermentation broth of the polyoxin²-producing micro-organism, *Streptomyces cacaoi* var. *asoensis*,³ and were considered to be

carbo-analogues of cyclic AMP,¹ the synthesis of the sugar portion of these nucleosides has been attempted. Thus, reaction of 1,2:5,6-di-*O*-isopropylidene- α -D-allofuranose (3)⁴ with ethyl bromoacetate in the presence of NaH afforded the ethyl ester (4), m.p. 89–90 °C; m/e 331 ($M^+ - \text{Me}$),[†] which was converted into the malonic acid derivative (5) by treatment in refluxing diethyl carbonate (b.p. 127 °C) with an equimolar amount of NaH; yield 80%; m.p. 50–51 °C, ν (KBr) 1740 and 1770 cm^{-1} (CO); m/e 403 ($M^+ - \text{Me}$); δ 4.78 (1H, s, $\text{EtO}_2\text{CCHCO}_2\text{Et}$). If (4) was treated with diethyl carbonate and NaH in tetrahydrofuran at 0 °C, the Claisen condensation product (6) (syrup) was obtained exclusively as a mixture of stereoisomers; m/e 631 ($M^+ - \text{Me}$); δ 5.68 – 5.88 (2H, m, 1- and 1'-H), and 4.72 (1H, s, $\text{EtO}_2\text{CCHCO}_2\text{Et}$).

Treatment of (5) in 70% acetic acid at 37 °C for 3 h afforded the partially deacetonated product (7) (82%), m.p. 53 °C; m/e 363 ($M^+ - \text{Me}$), which was converted into the monotosylate (8), (syrup) m/e 517 ($M^+ - \text{Me}$), by reaction with an equimolar amount of tosyl chloride (70%). With excess of tosyl chloride the ditosylate (9) (syrup) was obtained. Treatment of (8) with NaH afforded the epoxy compound (11) (syrup) as well as the product of C–C bond formation (12) (syrup) in a ratio of 1:2–3; (11): m/e (75 eV) 345 ($M^+ - \text{Me}$), 302 [$M^+ - \text{Me} - \text{CH}_2\text{CH}(\text{O})$], 169 [$M^+ - \text{Me} - \text{EtO}_2\text{CCH}(\text{O})\text{CO}_2\text{Et} - \text{H}$], and 127 [$M^+ - \text{Me} - \text{EtO}_2\text{CCH}(\text{O})\text{CO}_2\text{Et} - \text{CH}_2\text{CH}(\text{O})$]; δ 4.68 (1H, s, $\text{EtO}_2\text{CCHCO}_2\text{Et}$); (12): ν (KBr) 3500 (OH), 1700sh, and 1743 (CO) cm^{-1} ; δ (CDCl₃, Me₄Si) 2.31 and 2.77 (2H, 2 × dd, 6-H^a and -H^b, $J_{5,6a}$ 3, $J_{5,6b}$ 4, J_{gem} 15 Hz), 4.35 (1H, dd, 3-H, $J_{2,3}$ 4, $J_{3,4}$ 12 Hz), and 5.77 (1H, d, 1-H, $J_{1,2}$ 4 Hz). A

[†] All compounds were adequately characterised; only selected spectral data are reported.

large $J_{3,4}$ value in (12) corresponds well with the $J_{3,4}$ value of 10.5 Hz in octosyl acid A (1).¹

(7) R¹ = R² = H

(8) R¹ = *p*-MeC₆H₄SO₂, R² = H

(9) R¹ = R² = *p*-MeC₆H₄SO₂

(10) R¹ = *p*-MeC₆H₄SO₂, R² = MeCO

(12) R = H

(13) R = MeCO

(14) R = *p*-MeC₆H₄SO₂

Similarly, the ditosylate (9) and the acetyl tosyl compound (10) (syrup) were converted into the tosylate (14), m.p. 146–147 °C, m/e 499 ($M^+ - \text{Me}$), and the acetate (13) (syrup), m/e 387 ($M^+ - \text{Me}$), of (12). Compound (10) was prepared by treatment of (8) with Ac₂O–pyridine.

Treatment of (12) with 0.01N HCl in methanol resulted in initial cleavage of the furanose ring prior to release of Me₂CO to give (15), followed by further conversion into compound (16); (15): m.p. 90 °C, m/e 377 ($M^+ - \text{Me}$), and 361 ($M^+ - \text{OMe}$); δ (CDCl₃) 1.47 and 1.49 (6H, 2 × s, Me₂C<), 2.23 and 2.76 (2H, 2 × dd, 6-H^a and -H^b, $J_{5,6a}$ 3, $J_{5,6b}$ 4, J_{gem} 15 Hz), 3.41 (3H, s, MeO) and 5.33 (1H, d, 1-H, $J_{1,2}$ 1 Hz); (16): δ (CDCl₃) 2.21 and 2.77 (2H, 2 × dd, 6-H^a and -H^b, $J_{5,6a}$ 3, $J_{5,6b}$ 4, J_{gem} 15 Hz), and 3.44 and 3.76 (6H, 2 × s, OMe).

This acid lability of (12) may explain unsuccessful attempts to convert (12) into octosyl acid nucleosides through a route involving acetolysis of (12) using H₂SO₄ as catalyst followed by reaction with trimethylsilyluracil using SnCl₄ as catalyst.⁵

We thank Dr. S. Suzuki for interest and Drs. K. Isono and H. Ohruai for helpful discussions.
