

An Easy Synthesis of (*RS*)-[3'-¹³C]Mevalonic Acid Lactone

By A IAN SCOTT* and KOZO SHISHIDO

(Department of Chemistry, Texas A&M University, College Station, Texas 77843)

Summary A high-yielding synthesis of mevalonic acid lactone is described which is of particular value in the preparation of 3' labelled compounds

ALTHOUGH several elegant synthetic approaches ¹⁻⁵ to mevalonic acid lactone have been described in recent years, short and efficient routes applicable to preparation of the 3' and 3 labelled compounds are lacking We report herein an

improved synthesis of (*RS*)-mevalonic acid lactone by which 3' and 3 labelled derivatives can be conveniently prepared in good yield.

Reaction of ethyl acetate with 2.5 equiv. of allylmagnesium bromide in Et₂O-tetrahydrofuran (THF) (1:1) afforded the alcohol (**1**, 94%, b.p. 50–51 °C)³ which was subjected to ozonolysis in CH₂Cl₂-acetic acid (10:1) at –78 °C. Treatment of the crude product with H₂O₂-acetic acid gave the diacid (**2a**, 84%), m.p. 110–111 °C (lit.³ 110–111 °C), characterised as the dimethyl ester (**2b**, C₈H₁₄O₅) (CH₂N₂ in Et₂O, THF) which showed singlets at δ 1.39 (3H, Me), 2.73 (4H, CH₂), and 3.75 (6H, OMe) in the ¹H n.m.r. spectrum.

Treatment of (**2a**) with an excess of acetic anhydride at room temperature for 14 h afforded the anhydride (**3**) in quantitative yield [m.p. 102–103 °C (lit.⁶ 102–102.5 °C), *M*⁺ at *m/e* 144; i.r. (Nujol) 3530 (OH), 1813 and 1765 (anhydride CO) cm⁻¹; ¹H n.m.r. 1.43 (3H, Me), 2.67 (1H,

exchanged with D₂O, OH), 2.90 and 2.93 (each 2H, *J* 2.0 Hz, methylene H_{ax} and H_{eq})]. Treatment of the anhydride (**3**) with 2.5 equiv. of NaBH₄ in propan-2-ol,⁷ acidification to pH 2, and extraction with Et₂O gave almost pure (*RS*)-mevalonic acid lactone (**4**, 75.6%), which, after purification by column chromatography on SilicAR CC-7 using hexane–Et₂O as eluant, was identical (t.l.c., m.s., i.r., and n.m.r.) with an authentic sample.

This procedure offers significant advantage over routes involving hydride reduction of (**2b**)^{1,3} and is complementary to the method employed by Fetizon, *et al.*, via 3-methylpentane-1,3,6-triol.⁵

Utilizing the above procedure without purification of intermediates, (±)-[3'-¹³C]mevalonic acid lactone was prepared in 58% overall yield from [2-¹³C]ethyl acetate (90 atom%). The position of the ¹³C enrichment in the purified product was apparent from the ¹³C n.m.r. (single peak at 29.9 p.p.m.) and ¹H n.m.r. [3H doublet centred at δ 1.40, *J*(¹³C–H) 63.0 Hz] spectra. The isotopic enrichment of the product was >86% as determined from its ¹H n.m.r. spectrum.

We thank The Robert A. Welch Foundation for support of this work.
