Not the Alkoxycarbonylamino-acid O-Acylisourea

By N. LEO BENOITON* and FRANCIS M. F. CHEN

(Department of Biochemistry, University of Ottawa, Ottawa, Ontario K1N 9A9, Canada)

Summary The reaction of equivalent amounts of N-benzyloxycarbonyl-L-valine and N,N'-di-isopropylcarbodi-imide in deuteriochloroform gives an equimolar mixture of the symmetrical anhydride of the N-protected amino-acid, N,N'-di-isopropylurea, and unchanged carbodi-imide and not the O-acylisourea adduct as reported in the literature.

BATES et al.¹ reported that the addition of 1 equiv. of N, N'-di-isopropylcarbodi-imide (1a) to N-benzyloxycarbonyl-L-valine (2a) in deuteriochloroform leads to rapid, clean, and complete reaction with formation of O-(N-benzyl-oxycarbonyl-L-valyl)-N, N'-di-isopropylisourea (3a). The identity of the product was established on the basis that its ¹H n.m.r. (300 MHz) spectrum was different from that of the

 $R^1N=C=NR^1$ R²OCO.NH.CHR³.CO₂H (1 2(2)(1) (2) $\mathrm{R^2OCO.NH.CHR^3.CO_2C}(=\!\mathrm{NR^1}).\mathrm{NHR^1}$ (3) R²OCO.NH.CHR³.CO.N(R¹).CO.NHR¹ (4) (R²OCO.NH.CHR³.CO)₂O R¹NH.CO.NHR¹ $(\mathbf{5})$ (6) **a**; $R^1 = Pr^i$, $R^2 = PhCH_2$, $R^3 = Pr^i$ **b**; $R^1 = cyclohexyl$ Carbodi-imide (1a) (1a) + (2a) Anhydride (5a) (1a) + (5a) + (6a) Urea (6a) 7.0 6.0 5.0 4.0 3.0 5.0 4.0 3.0 2.0 1.0

FIGURE. Comparison of the ${}^{1}H$ n.m.r. spectrum of the mixture of (1a), (5a), and (6a) with that of a mixture of (1a) and (2a), and with spectra of (1a), (5a), and (6a).

 \dagger Based on a control experiment showing that N, N'-di-isopropylcarbodi-imide in deuteriochloroform survives the washes with dilute aqueous solutions.

isomeric and unreactive N-acylurea (4a). The spectrum of the recognised but heretofore elusive O-acylisourea remained unchanged for 9 h. On the other hand, when 0.5equiv. of N,N'-dicyclohexylcarbodi-imide (1b) [or Nethyl-N'-(γ -dimethylaminopropyl)carbodi-imide] is treated with an N-alkoxycarbonylamino-acid (2) in dichloromethane, the product is the symmetrical anhydride (5) and N,N'-dicyclohexylurea (6b) [equation (1)].^{2,3}

$$\mathbf{1b}) + 2 \ \mathbf{(2)} \longrightarrow \mathbf{(5)} + \mathbf{(6b)} \tag{1}$$

Our attempts to prepare the symmetrical anhydride of N-t-butoxycarbonyl-N-methylvaline led to the realisation that if more than 0.5 equiv. of N,N'-dicyclohexylcarbodiimide was used, not all the carbodi-imide was consumed and moreover some of it survived the usual washes² with dilute aqueous citric acid and sodium hydrogen carbonate. This prompted us to examine the claim of Bates *et al.*¹ We find similarly that unchanged N,N'-di-isopropylcarbodiimide (**1a**) remains† after work-up as above of an equimolar mixture of (**1a**) and N-benzyloxycarbonyl-L-valine (**2a**). In fact the solution contains the anhydride (**5a**)² and

1.0

N,N'-di-isopropylurea (**6a**) as well. Finally, when an n.m.r. spectrum was taken in deuteriochloroform[‡] of an equimolar mixture of the anhydride (**5a**),² carbodi-imide (**1a**), and urea (**6a**),§ the spectrum was indistinguishable from that exhibited by an equimolar mixture of acid (**2a**) and carbodi-imide (**1a**) (Figure). Furthermore, n.m.r. spectra taken separately of (**1a**), (**5a**), and (**6a**) (Figure) when super-imposed gave a curve identical with the other two spectra.

We conclude that the reaction between equimolar amounts of (1a) and (2a) in deuteriochloroform is the same as in equation (1) except that one half of the carbodi-imide is not involved in the reaction [equation (2)].

$$(1\mathbf{a}) + 2 (2\mathbf{a}) + (1\mathbf{a}) \longrightarrow (5\mathbf{a}) + (\mathbf{6}) + (1\mathbf{a})$$
 (2)

All proton assignments made by Bates *et al.*¹ attributed to structure (**3a**) can be applied to the corresponding protons in the mixture of (**1a**), (**5a**), and (**6a**), the only difference in structure being $-CH \cdot NH \cdot C(=N \cdot)O-$ in (**3a**) *vs*. $-CH \cdot NH \cdot C(=O) \cdot N-$ in (**6a**). The reported stability in deuteriochloroform for 9 h of the activated amino-acid derivative formed from (1a) and (2a) is consistent with the known properties of $(5a)^2$ which is stable in this solvent at 50 °C for 3 h. Supporting evidence for the validity of equation (2) is provided by the observation that an equimolar mixture of N,N'-dicyclohexylcarbodi-imide (1b) and N-benzyloxycarbonyl-L-valine (2a) or N-t-butoxycarbonyl-N-methyl-L-valine in dichloromethane gives a 50% yield of N,N'-dicyclohexylurea (6b) when filtered after 15 min. The implication is that equation (3) is the general reaction in these solvents.

$$(1) + (2) \longrightarrow \frac{1}{2} (5) + \frac{1}{2} (6) + \frac{1}{2} (1)$$
(3)

Added in proof: Dr. J. H. Jones has expressed his agreement with the conclusions of this submission.

(Received, 2nd February 1981; Com. 121.)

[‡] The 60 MHz ¹H n.m.r. spectra of 0.05 M solutions in CDCl₃ gave the following data: δ (1a): 3.57 (septet, 1H, Me₂CH) and 1.23 (d, 6H, Me_2 CH); δ (5a): 7.35 (s, 5H, ArH), 5.25 (d, 1H, PhCH₂OCONH), 5.10 (s, 2H, PhCH₂), 4.35 (dd, 1H, NHCHCO), 2.20 (m, 1H, CHMe₂), and 1.05 and 0.95 (2 × d, 6H, Me_2 CH); δ (6a): 3.6—4.5 (m, 2H, Me₂CHNH and Me₂CHNH) and 1.14 (d, 6H, Me_2 CHNH). Same assignments for the mixtures. Some urea (6a) precipitated out of the solutions of the mixtures.

§ M.p. 190-192 °C, prepared by evaporating a solution of (1a) in aqueous tetrahydrofuran containing a drop of hydrochloric acid.
