Optically active 3-aryl-3-hydroxyesters of high enantiomeric excess ( $80-92 \%$ e.e.) are obtained by the reduction of 3 -aryl-3-oxoesters with lithium borohydride which has been chirally modified with $N, N^{\prime}$-dibenzoylcystine and t -butyl alcohol.

Optically active 3-hydroxyesters (1) form an important class of compounds. ${ }^{1}$ Asymmetric reductions of 3 -oxoesters (2) to (1) by microbial ${ }^{2}$ or chemical (modified Raney nickel ${ }^{3}$ ) methods are known. However, very few examples of the reduction of (2; $\mathbf{R}^{1}=$ aryl) have been reported. ${ }^{2 \mathrm{a}}$

During our continuing study on chemoselective ${ }^{4}$ and asymmetric ${ }^{5}$ reduction with complex borohydrides, we observed a highly enantioselective reduction of $\left(\mathbf{2} ; \mathbf{R}^{1}=\right.$ aryl) by $\mathrm{LiBH}_{4}$ partially decomposed with $N, N^{\prime}$-dibenzoylcystine (3) and $\mathrm{Bu}^{+} \mathrm{OH}$. When ethyl benzoylacetate (2b) was reduced in the presence of $\left(R, R^{\prime}\right)-(\mathbf{3}),(R)-(+)-(\mathbf{1 b})$ was obtained in $94 \%$ yield and in $87 \%$ enantiomeric excess (\%e.e., Table 1, entry 2 ). $\dagger$ The chiral auxiliary was recovered in over $70 \%$ yield.

[^0]Esters of sec-, tert-alcohols (2c, e), and ethyl 1-naphthoylacetate (2i) were found to be slightly more effectively reduced, thus the \%e.e.'s of (1c, e, i) reached $90 \%$ (entries 4, 6, and 10).

a; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{Me}$
b; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{Et}$
c; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{Pr}{ }^{\mathrm{i}}$
d; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{Bu}^{\mathrm{n}}$
e; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{Bu}^{\mathrm{t}}$
f; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{n}$-Hexyl
g; $\mathrm{R}^{1}=p$-Tolyl, $\mathrm{R}^{2}=\mathrm{Et}$
h; $\mathrm{R}^{1}=4-\mathrm{MeO}-\mathrm{C}_{6} \mathrm{H}_{4}, \mathrm{R}^{2}=\mathrm{Et}$
i; $\mathrm{R}^{1}=1$-Naphthyl, $\mathrm{R}^{2}=\mathrm{Et}$
(3) $=N, N^{\prime}$-Dibenzoylcystine, THF $=$ tetrahydrofuran

Table 1. Asymmetric reduction of (2) to (1). ${ }^{\text {a }}$

| 5 | d | 83 | $+35.2^{\circ}\left(3.78, \mathrm{CHCl}_{3}\right)$ | 80 |  |
| 6 | e | 88 | $+9.6{ }^{\circ}(3.03, \mathrm{EtOH})$ | 90 |  |
| 7 | f | 66 | $+31.6^{\circ}\left(4.87, \mathrm{CHCl}_{3}\right)$ | 86 |  |
| 8 | g | 88 | $+38.6^{\circ}\left(4.59, \mathrm{CHCl}_{3}\right)$ | 85 |  |
| 9 | h | 85 | $+35.7^{\circ}\left(5.26, \mathrm{CHCl}_{3}\right)$ | 84 |  |
| 10 | i | 90 | $+62.3^{\circ}\left(3.55, \mathrm{CHCl}_{3}\right)$ | 92 |  |

${ }^{\text {a }}$ Molar ratio of $(\mathbf{2}): \mathrm{LiBH}_{4}:(\mathbf{3}): \mathrm{Bu}{ }^{\mathrm{t}} \mathrm{OH}=1.0: 3.6: 1.2: 1.6$. Temperature $\left(-78 \rightarrow-30^{\circ} \mathrm{C}\right)$. Unless otherwise noted, $\left(R, R^{\prime}\right)$ (3) was used. b Determined by ${ }^{1} \mathrm{H}$ n.m.r. spectroscopic analyses of the corresponding ( - )- $\alpha$-methoxy- $\alpha$-(trifluoromethyl)phenylacetic acid esters, J. A. Dale, D. L. Dull, and H. S. Mosher, J. Org. Chem., 1969, 34, 2543. © Based on the reported value of ( $R$ )-(1a) $\{\alpha\}_{\mathrm{D}}{ }^{24}$ $+18.3^{\circ}(c 4.78, \mathrm{EtOH}), \mathrm{C}$. Schoepf and W. Wuest, Ann., 1959, 626, 150. d Based on the reported value of $(S)-(\mathbf{1 b})[\alpha]_{\mathrm{D}}{ }^{22}-54.9^{\circ}$ ( c 3.5, $\mathrm{CHCl}_{3}$ ), S. G. Cohen and S. Y. Weinstein, J. Am. Chem. Soc., 1964, 86, 725. e $\left(S, S^{\prime}\right)-(\mathbf{3})$ was used. ${ }^{\mathrm{f}}$ Data measured in different concentration. See footnote $\dagger$.

One of the advantages of the present procedure over microbial methods is its easy access to either enantiomer of (1). The reduction of ( $\mathbf{2 b}$ ) using either $\left(R, R^{\prime}\right)-(\mathbf{3})$ or $\left(S, S^{\prime}\right)-(\mathbf{3})$ afforded the corresponding enantiomer of (1b) in almost the same yield and \%e.e. (entries 2 and 3 ).

[^0]:    $\dagger(S)-(-)-(\mathbf{l b})$, produced via yeast reduction $\left\{[\alpha]_{D^{20}}-25.8^{\circ}\right.$ (c 1.3, $\left.\left.\mathrm{CHCl}_{3}\right)\right\}$, ref. 2a, is claimed to be optically pure based on the lit. value of $[\alpha]_{\mathrm{D}^{20}}+19.2^{\circ}\left(c 1.0, \mathrm{CHCl}_{3}\right)$ (J. Kenyon, H. Phillips, and G. R. Schutt, J. Chem. Soc., 1935, 1663). However, the specific rotation of our $(S)-(-)-(\mathbf{1 b})$ had a larger value: $[\alpha]_{\mathrm{D}}{ }^{22}-40.8^{\circ}(c 1.03$, $\mathrm{CHCl}_{3}$ ) (Table 1, entry 3).
