# Intermolecular Imine Formation: Condensation of Organic Molecules with Hexammine $\mathbf{R u}{ }^{1 I I}$ and $\mathbf{P t}^{\text {IV }}$ Ions 

By I. Philip Evans, Grover W. Everett, Jr., and Alan M. Sargeson*<br>(Research School of Chemistry, The Australian National University, Canberra, A.C.T. 2600, Australia)

Summary $\mathrm{M}\left(\mathrm{NH}_{3}\right)_{\mathrm{g}}{ }^{n+}\left(\mathrm{M}=\mathrm{Ru} \mathrm{III}\right.$ and $\left.\mathrm{PtIV}^{\mathrm{IV}}\right)$ ions condense with dicarbonyl compounds to give chelates where the co-ordinated nucleophile is the effective agent in the reaction and the resulting, normally unstable, organic group is stabilised.

Several intramolecular reactions have been described recently ${ }^{1}$ where condensation has occurred between carbonyl centres and co-ordinated nucleophiles to give chelated organic molecules sometimes of surprising complexity

and specificity. In one instance two co-ordinated $\mathrm{OH}^{-}$ groups have been shown to capture the carbonyl centres on acetylacetone ${ }^{2}$ and this could also occur with co-ordinated $\mathrm{NH}_{2}{ }^{-}$if the concentration of the nucleophile can be made reasonably high. Using metal hexammine complexes, $\mathrm{M}\left(\mathrm{NH}_{3}\right)_{{ }_{6}}{ }^{n+}$, of suitable acidity it should be possible to generate $\mathrm{M}\left(\mathrm{NH}_{3}\right)_{5} \mathrm{NH}_{2}{ }^{(n-1)+}$ ions in substantial concentration in basic solution. Condensation of such species with a carbonyl group followed by deprotonation of another coordinated ammonia and the capture of another carbonyl centre can stabilise imines difficult or impossible to synthesise by more traditional routes.
The $\mathrm{Ru}\left(\mathrm{NH}_{3}\right)_{8}{ }^{8+}$ ion has a $\mathrm{p} K_{\mathrm{a}}$ of $c a .12 \cdot 4^{3}$ and hence substantial deprotonation of the complex could be expected in $1 \mathrm{~m} \mathrm{OH}{ }^{-}$. In the presence of biacetyl and base this complex generates an intense red-brown solution from which the yellow-brown complex (1) was isolated [ca. $65 \%$ yield, characterised by elemental analysis and ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy, $\delta\left(\left[{ }^{2} \mathrm{H}_{6}\right] \mathrm{Me}_{2} \mathrm{SO}\right)$ (rel. to $\mathrm{Me}_{4} \mathrm{Si}$ ) $-11.83(2 \mathrm{NH}),-3.28$ $\left(2 \mathrm{NH}_{3}\right),-2.38(2 \mathrm{Me})$ and $\left.-1.67\left(2 \mathrm{NH}_{3}\right)\right]$. INDOR nitrogen spectra confirm that the signals at $\delta-3.28$ and -1.67 are due to co-ordinated ammonia. The electronic spectrum of the product showed the characteristic intense absorption ( $\epsilon_{465} 7200 \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ in $10^{-3} \mathrm{M} \mathrm{HClO}_{4}$ ) of $\mathrm{RuII}^{\text {II }}$ attached to an unsaturated $N$-centre. ${ }^{4}$ The RuII complex was readily oxidised with bromine water to the $\mathrm{Ru} \mathrm{HII}^{\text {ion }}$, which was also isolated as the perchlorate salt. The redox process was reversible with $E=0.54 \mathrm{~V}$ (IUPAC convention; established by cyclic voltammetry and AC polarography,
$\mu=0.1 \mathrm{~m} \mathrm{NaClO}, 22^{\circ}$ ) and the $\mathrm{Ru}^{\mathrm{III}}$ ion was moderately stable in dilute acid but was reduced rapidly in base. The reduction in 1 m NaOH followed first-order kinetics with $t_{\mathrm{t}}=25 \mathrm{~s}$ at $25^{\circ}$; in 0.05 m collidine buffer at pH 7.43 the half life was $c a .30 \mathrm{~s}$. This rapid reduction accounts for the isolation of the $\mathrm{RuII}^{\text {Ion }}$ from the reaction medium but the oxidised grouping has not yet been detected. In $1 \mathrm{~m} \mathrm{OH}^{-}$ clearly $\mathrm{H}_{2} \mathrm{O}$ could be oxidised but in the buffer at pH 7.43 another reductant is required.

Preliminary kinetics on the formation of the RuII complex in 0.05 m collidine at pH 7.36 ( $\mu=1.0 \mathrm{~m}$ in NaCl ) showed a first-order dependence on biacetyl and Ru$\left(\mathrm{NH}_{3}\right)_{6}{ }^{3+}$ with a second-order rate constant of $5.16 \times 10^{-3}$
$\mathrm{M}^{-1} \mathrm{~s}^{-1}$ at $25^{\circ}$. For most of the kinetics, reduction was much faster than the formation process; only at high concentrations of biacetyl ( $>0.5 \mathrm{~m}$ ) was it competitive. We presume the process is initiated by attack of $\mathrm{Ru}\left(\mathrm{NH}_{3}\right)_{5^{-}}$ $\mathrm{NH}_{2}{ }^{2+}$ at a carbonyl centre of biacetyl followed by further deprotonations, cyclisation and elimination of water as shown in the Scheme. Since deprotonation of $\mathrm{Ru}\left(\mathrm{NH}_{3}\right)_{\mathbf{6}}{ }^{3+}$ is fast ${ }^{5}$ and the kinetics are first order in complex and ligand, the attack of the co-ordinated nucleophile is a feasible rate-determining step.

A substantial driving force for the reaction is the stabilisation of the $\mathrm{Ru}{ }^{I I}$ species by the di-imine grouping (compare the potential of the $\left(\mathrm{NH}_{3}\right)_{6} \mathrm{Ru}^{2+/ 3+}$ couple, $\left.0 \cdot 10^{6}\right)$, which probably accounts also for the ease of oxidation of ethylenediamine in $\mathrm{Ru}(\mathrm{en})_{3}{ }^{2+}$ to produce the analogous di-imine complex. ${ }^{4 \mathrm{~b}}$

There is now excellent evidence to indicate that the $t_{2 g}$ electrons in $\mathrm{Ru}^{I I}$ species are extensively involved in bonding with such unsaturated $N$-ligands ${ }^{40,7}$ and are much less involved in the $\mathrm{Ru}^{\mathrm{II}}$ species. The ability of Ru to stabilise such unsaturated chelate species appears to be a general one and related complexes such as (2) and (3) have been made by similar means.

Platinum(rv)-ammine complexes may also be used and both 2,4 -pentanedione and 1,1,1-trifluoro-2,4-pentanedione condense rapidly with $\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{8}{ }^{3+}$ at $\mathrm{pH} c a .9$ togive the stable ring systems (4) and (5). The complexes were isolated as perchlorates and the ${ }^{1} \mathrm{H}$ n.m.r. spectra were consistent with the formulation. The equivalence of the methyl groups for the anionic ligand indicates complete delocalisation and the ring readily brominates at the methine centre with bromine.
