## Rapid Transfer of Selenium from Tertiary Phosphine Selenides to Tertiary Phosphines

By DOUGLAS H. BROWN, RONALD J. CROSS,\* and RODNEY KEAT\* (Chemistry Department, The University, Glasgow G12 8QQ)

Summary The title reaction, which is fast on the n.m.r. time-scale and is concentration dependent, resembles more closely the analogous process with phosphine tellurides rather than that with phosphine sulphides.

THE transfer of sulphur atoms from tertiary phosphine sulphides to more basic phosphine molecules is well documented, and finds numerous synthetic applications.<sup>1</sup> An extension of this reaction is the redistribution of sulphur in unsymmetrical methylene-diphosphine monosulphides [equation (1)].<sup>2</sup> With the heavier chalcogens, the transfer of tellurium from phosphine tellurides to the analogous

$$Heat Ph_{2}P(S)CH_{2}PMe_{2} \rightarrow Ph_{2}PCH_{2}P(S)Me_{2}$$
(1)

tertiary phosphine is fast on the n.m.r. time-scale at ambient temperatures.<sup>3,4</sup> Nothing has been reported

concerning the transfer of selenium between phosphorus atoms.

We find that the exchange of selenium between tertiary phosphine selenides and the analogous tertiary phosphine is fast on the n.m.r. time-scale at elevated temperatures (Table). Thus the two singlet methyl resonances, produced after <sup>31</sup>P decoupling, of mixtures of Ph<sub>2</sub>MePSe and Ph<sub>2</sub>MeP broaden and coalesce as the temperature is increased. The coalescence covers a wide range of temperatures and is difficult to measure accurately,<sup>†</sup> but it is obviously concentration dependent. The methylene signals from the mixtures of Ph<sub>2</sub>P(Se)CH<sub>2</sub>PPh<sub>2</sub> and Ph<sub>2</sub>PCH<sub>2</sub>PPh<sub>2</sub>, and of Ph<sub>2</sub>P(Se)C<sub>2</sub>H<sub>4</sub>P(Se)Ph<sub>2</sub>, Ph<sub>2</sub>P(Se)C<sub>2</sub>H<sub>4</sub>PPh<sub>2</sub>, and Ph<sub>2</sub>PC(Se)C<sub>2</sub>H<sub>4</sub>PPh<sub>2</sub> display similar behaviour. This is consistent with an intermolecular transfer of selenium. Although the coalescence temperatures of Ph<sub>2</sub>MePSe with Ph<sub>2</sub>MeP and Ph<sub>2</sub>P(Se)CH<sub>2</sub>PPh<sub>2</sub> with Ph<sub>2</sub>PCH<sub>2</sub>PPh<sub>2</sub> are

TABLE. Coalescence temperatures<sup>a</sup>

Components	Concentrations <sup>b</sup> /mol l <sup>-1</sup> (Coalescence temp./K)			
Ph <sub>2</sub> MePSe Ph <sub>2</sub> MeP	$egin{array}{c} 0{\cdot}33 \ 0{\cdot}33 \end{array} \}$ ( $>$ 447)	$\left. \begin{smallmatrix} 0\cdot 36\\ 0\cdot 72 \end{smallmatrix} \right\}$ (438)	$\left. \begin{array}{c} 0\cdot 67\\ 1\cdot 32 \end{array} \right\}$ (428)	$\left. rac{1\cdot 0}{2\cdot 0} \right\}$ (418)
Ph <sub>2</sub> P(Se)CH <sub>2</sub> PPh <sub>2</sub> Ph <sub>2</sub> P(Se)CH <sub>2</sub> PPh <sub>2</sub> Ph <sub>2</sub> PCH <sub>2</sub> PPh <sub>2</sub> Ph <sub>2</sub> P(Se)CH <sub>2</sub> P(Se)Ph <sub>2</sub> Ph <sub>2</sub> P(Se)CH <sub>2</sub> PPh <sub>2</sub>	$\begin{array}{c} 0.53 \\ 0.53 \\ 0.27 \\ 0.67 \\ 0.67 \\ 0.67 \\ 0.443 \end{array} (>443)$	$\left. \begin{matrix} 0.67\\ 0.67 \end{matrix} \right\}$ (418)	$\left.\begin{array}{c}1\cdot0\\1\cdot0\end{array}\right\}(411)$	-
$\begin{array}{l} Ph_2P(Se)C_2H_4P(Se)Ph_2\\ Ph_2P(Se)C_2H_4P(h_2)\\ Ph_2P(Se)C_2H_4PPh_2\\ Ph_2PC_2H_4PPh_2 \end{array}$	$ \begin{array}{c} 0.07 \\ 0.20 \\ 0.40 \\ 0.20 \end{array} $ (398°)	$\left. \begin{matrix} 0\cdot 33 \\ 0\cdot 67 \\ 0\cdot 33 \end{matrix} \right\}$ (368)		

<sup>a</sup> Measured at 60 MHz on a JEOL C60HL spectrometer with noise-modulation of the <sup>31</sup>P irradiation field ( $P^v$  and  $P^{III}$  signals generally separated by *ca.* 1 kHz). Temperatures  $\pm 10$  K. <sup>b</sup> *o*-Dichlorobenzene solutions. <sup>c</sup> Chlorobenzene solution.

<sup>†</sup> We define the coalescence temperature as the lowest temperature at which no valley can be discerned between the individual signals.

comparable, 1,2-bis(diphenylphosphino)ethane with its mono- and di-selenide coalesced at lower temperatures, and  $Ph_2P(Se)CH_2PPh_2$  alone or with  $Ph_2P(Se)CH_2P(Se)Ph_2$ failed to reach coalescence in the temperature range examined. Obviously the nature of the substituents on phosphorus affects the rate of selenium exchange.

N.m.r. investigations also show that equimolar solutions of Ph<sub>2</sub>P(Se)CH<sub>2</sub>P(Se)Ph<sub>2</sub> and Ph<sub>2</sub>PCH<sub>2</sub>PPh<sub>2</sub> react quantitatively to produce Ph<sub>2</sub>P(Se)CH<sub>2</sub>PPh<sub>2</sub> immediately on mixing, whereas  $Ph_2P(Se)C_2H_4P(Se)Ph_2$  and  $Ph_2PC_2H_4PPh_2$  equilibrate to a 1:2:1 mixture of  $Ph_2P(Se)C_2H_4P(Se)Ph_2$ , Ph<sub>2</sub>P(Se)C<sub>2</sub>H<sub>4</sub>PPh<sub>2</sub>, and Ph<sub>2</sub>PC<sub>2</sub>H<sub>4</sub>PPh<sub>2</sub> at a similar rate. This difference in the nature of the products is presumably because the more electron deficient  $\mathrm{P}^v$  atom affects the activity of the P<sup>III</sup> atom in Ph<sub>2</sub>P(Se)CH<sub>2</sub>PPh<sub>2</sub>, but not in  $Ph_2P(Se)C_2H_4PPh_2$  where the phosphorus atoms are separated by two  $CH_2$  groups. We find that the analogous reactions of phosphine sulphides are similar [equations (2) and (3)], though much slower. Equilibrium is reached after about 24 h at 160 °C (in the absence of solvent, or in o-dichlorobenzene solution) but requires more than 40 days

$$\begin{array}{rl} \mathrm{Ph_2P(S)CH_2P(S)Ph_2} + & \mathrm{Ph_2PCH_2PPh_2} \rightarrow \\ & & \mathrm{Ph_2P(S)CH_2PPh_2} \end{array} \tag{2}$$

$$Ph_{2}P(S)C_{2}H_{4}P(S)Ph_{2} + Ph_{2}PC_{2}H_{4}PPh_{2} \rightleftharpoons Ph_{2}P(S)C_{2}H_{4}PPh_{2} \qquad (3)$$

at 80 °C in benzene solution. The redistribution of sulphur, selenium, and tellurium<sup>4</sup> between phosphorus atoms in methylene diphosphine systems thus appears to be a general process, of which reaction (1) is but a specific example. Seen in this light, the detection of ca. 10% of  $Ph_2P(S)$ -CH<sub>2</sub>P(S)Me<sub>2</sub> and Ph<sub>2</sub>PCH<sub>2</sub>PMe<sub>2</sub> amongst the products of reaction (1) is not remarkable.<sup>2</sup> The rate of chalcogen atom transfer between phosphines is seen to increase in the order S<<Se<Te.

We thank the S.R.C. for a maintenance award (to D.H.B.).
