TWO NEW BOOKS FOR TEACHERS AND STUDENTS OF CHEMISTRY

Water

by Felix Franks

The Royal Society of Chemistry is in the process of introducing a new series of inexpensive texts for students and teachers of chemistry. Topics covered will relate to those subjects which are commonly featured in courses on chemistry and related areas, which are currently being taught in schools, universities, and colleges.

The first book in the series, about to be published, is entitled — Water.

The book considers the present state of our knowledge of liquid water, its remarkable physical properties and how these give rise to a unique liquid structure, its influence on the interactions between solutes, its role in maintaining biologically active structures, its involvement in chemical reactions and the problems posed by its management and in providing sufficient amounts of water of adequate quality.

Contents:

Occurrence, importance and physical properties; The place of water in the general classification of liquids; Isotopic composition; The structure of the water molecule and the nature of the hydrogen bond in water; Ice — Its structure and dynamics; The structure of liquid water; The dynamic properties of liquid water; Towards a molecular description of water; Aqueous solutions of simple molecules; Aqueous solutions of electrolytes; The role of water in the stabilisation of biologically significant structures; Reactions in aqueous solutions; Water in the environment — quality, availability and exploitation; Summary and future prospects.

A Thermodynamic Bypass: GOTO Log K

by P. A. H. Wyatt

Monographs for Teachers present concise and authoritative accounts of selected but well-defined topics in chemistry for the guidance of teachers and students in higher education. A Thermodynamic Bypass: GOTO Log K is the latest title in this popular series.

Approaching chemical thermodynamics by concentrating on $\log_{10} K$ values permits a good deal of chemistry to be discussed in quantitative terms before anything which passes for 'thermodynamics' is tackled. Professor Wyatt's book contains an appendix of $\log K$, H_f° , and S° values for a large number of elements and compounds; this table can be used in much the same way as tables of logarithms were used before the pocket calculator revolution.

A number of topics including equilibrium constants, the phase rule, energy, entropy, enthalpy, the Gibbs function, and chemical potentials and activities are dealt with. There are 11 pages of worked examples.

Brief Contents:

Principal Symbols Used; Equilibrium Constants; Fixing Variables in Solving Equilibrium Problems; Combining Equilibrium Constants; Some Worked Examples; Energy and Entropy; The Gibbs Function; Chemical Potentials and Activities in Chemical Equilibria; Perspective.

THE UNIVERSITY OF MANCHESTER
Department of Chemistry
POST-DOCTORAL RESEARCH
ASSISTANTSHIP IN ORGANIC
CHEMISTRY

Applications are invited for an SERC Research Assistantship with Dr. L. M. Harwood for the evaluation of synthetic approaches towards inside functionalised carbocycles. Applicants should have a strong background in organic synthesis. The post is initially available for one year, starting October 1st, 1983, with possible renewal for a second year. Salary range p.a.: £6,375-£8,085 (Superannuation) depending on age and experience. Candidates should send a curriculum vitae and names and addresses of referees to Dr. L. M. Harwood, Department of Chemistry, The University, Manchester M13 9PL.
