# NEW BOOKS FOR *Organic Chemists.*

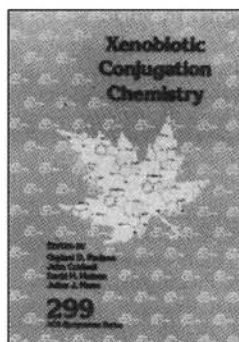

## Xenobiotic Conjugation Chemistry

Edited by G. D. Paulson, J. Caldwell, D. H. Hutson and J. J. Menn

This 16-chapter state-of-the-art review relates metabolic conjugation of xenobiotics to their environmental use, focusing on the many advances made since 1975. Sections on the biosynthesis of xenobiotic conjugates in mammals, fish, insects and plants; analytical

methodology; and novel reactions and consequences critically review, evaluate and summarise these recent advances. Unique in its consideration of the complete spectrum of species, its detailed methodology, and its assessment of the significance of conjugation, the book should be valuable to researchers, toxicologists and regulatory agencies, among many others who must evaluate the significance of xenobiotic conjugation.

## Applications of NMR Spectroscopy to Problems in Stereochemistry and Conformational Analysis

Edited by Y. Takenchi and P. Marchand

Dramatic developments including NMR elucidation of conformation and stereochemistry of high molecular weight

polymers and biopolymers, as well as the advent of two dimensional NMR have led to a virtual explosion of interest in the applications of NMR spectroscopy to structural and stereochemical problems. This fifth volume in the series "Methods in Stereochemical Analysis" explores these applications through a multi-authored form. Contributions from diverse segments of the chemical community include new NMR applications to the study of conformational analysis of guest-host molecular systems, the uses of NMR spectroscopy in the study of stereochemical problems in the solid state, and the methodology of NMR investigation in liquid crystals. Concepts and applications of two

dimensional NMR spectroscopy are also thoroughly examined and will assist both the chemist and biochemist concerned with molecular stereochemistry and conformational analysis, in the maintenance of an acute awareness of trends in this flourishing interdisciplinary field.

## Organic Synthesis

Edited by J. Fuhrop and G. Penzlin

This book is aimed at the advanced student of chemistry and research chemists. It attempts to convey knowledge about concepts, methods, starting materials and some target molecules, which are thought to be

important to modern organic synthesis. Also, the application of this knowledge to retrosynthetic analysis and the design of synthesis plans is described. Important concepts are summarized at the beginning of each chapter. They include the synthon approach, systematic evaluation of the arrangement of functionality, strategies to achieve region- and stereoselectivity in carbon-carbon bond formation and functional group conversions, strategies to enforce

thermodynamically unlikely reactions and retrosynthetic analysis.

A list of commercial starting materials tells the chemist working in organic synthesis what industry is able to do for him and a selection of more complex procedures shows what he may aim for.

## CLASSIFIED ADVERTISEMENTS

### The Dyson Perrins Laboratory UNIVERSITY OF OXFORD POSTDOCTORAL RESEARCH POSITION

Applications are invited for the above SERC funded post in collaboration with Dr. L. M. Harwood to work on synthetic approaches to the taxane diterpenes. A good training in synthetic organic chemistry is essential.

The appointment will be for one year in the first instance with the possibility of renewal for a further year. Salary will be on the RA 1A range £8,020-£8,505 p.a. (under review) and the starting point will depend on age and qualifications.

Applications, together with a curriculum vitae and the names of two referees should be sent to Dr. L. M. Harwood, Dyson Perrins Laboratory, University of Oxford, South Parks Road, Oxford OX1 3QY.
