Intramolecular alkylation of the enolates derived from the esters (3) and (7) stereoselectively afforded the cyclopentanecarboxylate (4) and the cyclobutanecarboxylate (8), respectively; compound (8) is a potential intermediate for the synthesis of  $(\pm)$ -fragranol (10).

Vicinally substituted cycloalkanecarboxylates (1a—c) are frequently employed as intermediates in the synthesis of natural products. We recently reported a highly stereoselective, efficient route to cis-1,2-dialkylcyclohexanecarboxylate systems (1a) by intramolecular ester enolate alkylation. The limited number of highly stereoselective methods for construction of cis-1,2-dialkylcyclopentane- and cyclobutanecarboxylates (1b,c), coupled with the significance of these compounds in natural product synthesis, prompted us to extend our alkylation methodology to smaller rings.<sup>2</sup>

The intramolecular alkylation substrate (3) for the synthesis of a five-membered ring system was prepared from the known lactol (2)<sup>3</sup> in a straightforward six-step sequence in 56% overall yield as summarized in Scheme 1.

Upon treatment with lithium di-isopropylamide in tetrahydrofuran at  $-78\,^{\circ}$ C for 1 h, compound (3) underwent smooth cyclization to furnish a 92:8 mixture of cyclopentane-carboxylates (4) and (5) in 45% unoptimized yield.† Use of potassium hexamethyldisilazide as base gave a less satisfactory 88:12 mixture in comparable yield. Stereochemical assignments of (4) and (5) were based upon the differences in the chemical shifts (see structures) of the quaternary methyl and ethyl ester methylene groups in their 200 MHz <sup>1</sup>H n.m.r. spectra (vide infra) due to the shielding effect of the adjacent vinyl group.<sup>4</sup>

Stereoselective construction of four-membered ring systems is illustrated in the context of synthesis of cyclobutanecarboxylates (8) and (9), potential intermediates for  $(\pm)$ -fragranol (10) and  $(\pm)$ -grandisol (11).5‡ The key cyclization substrate (7) was prepared from the known homoallylic alcohol (6)6 by a conventional five-step sequence (Scheme 2).

Alkylative cyclization of the tosylate (7) with lithium di-isopropylamide in THF at  $-78\,^{\circ}\text{C}$  to room temperature gave a 97:3 mixture of cyclobutanecarboxylates (8) and (9) in 45% yield.† The corresponding potassium enolate generated

† The ratio of stereoisomers was determined by capillary g.c. analysis  $(0.2 \text{ mm i.d.} \times 50 \text{ m}; \text{CBP-1})$ . The volatility of the products might be responsible for the moderate isolated yields. All new compounds gave satisfactory spectral data. Compound (4): i.r. (film) v 1740 cm<sup>-1</sup>; <sup>1</sup>H n.m.r.  $(200 \text{ MHz}, \text{CDCl}_3) \delta 5.71 \text{ (m, 1H)}, 4.98 \text{ (m, 1H)}, 4.92 \text{ (m, 1H)},$ 4.06 (q, J7 Hz, 2H), 2.82 (m, 1H), 2.30-1.40 (m, 6H), 1.17 (t, J7 Hz)3H), 0.99 (s, 3H); <sup>13</sup>C n.m.r. (20.15 MHz, CDCl<sub>3</sub>)  $\delta$  177.69, 138.32, 115.43, 60.29, 52.10, 51.10, 38.20, 29.63, 22.43, 18.44, 14.25. (8): i.r. (film) v 1740 cm<sup>-1</sup>; <sup>1</sup>H n.m.r. (80 MHz, CDCl<sub>3</sub>) δ 4.90 (m, 1H), 4.69 (br. s, 1H), 4.16 (q, J 7 Hz, 2H), 3.23 (t, J 7 Hz, 1H), 2.45—1.78 (m, 4H), 1.65 (s, 3H), 1.26 (t, J7 Hz, 3H), 1.16 (s, 3H). (9): An authentic sample was prepared from the corresponding acid<sup>5</sup> by treatment with Triton B and Etl in THF at room temperature: i.r. (film) v 1740 cm<sup>-1</sup>; <sup>1</sup>H n.m.r. (80 MHz, CDCl<sub>3</sub>) δ 4.78 (br. s, 1H), 4.67 (br. s, 1H), 4.10 (q, J7 Hz, 2H), 2.82 (t, J7 Hz, 1H), 2.40-1.83 (m, 4H), 1.71 (s, 3H),1.46 (s, 3H), 1.23 (t, J 7 Hz, 3H).

by treatment of (7) with potassium hexamethyldisilazide afforded a 95:5 mixture of (8) and (9) in 65% yield. The chemical shift values of the quaternary methyl and methine protons in (8) and (9) were again diagnostic for the stereochemistry.†

The observed high stereoselectivity in these alkylations can best be rationalized by considering that the reactions proceed via the more stable 'eclipsed' transition state geometry (12), rather than the 'bisected' one (13). This should be noted that the presumably less aggregated and more reactive potassium enolate gave slightly inferior stereoselectivity compared to the corresponding lithium enolate in all cases (n = 2, 1, 0) studied

Scheme 1. Reagents: i, Ph<sub>3</sub>P=CHCO<sub>2</sub>Et, CH<sub>2</sub>Cl<sub>2</sub>, reflux, 2 h; ii, Bu<sup>1</sup>Ph<sub>2</sub>SiCl, imidazole, dimethylformamide, room temp., 2 h (93% for 2 steps); iii, Bu<sup>1</sup><sub>2</sub>AlH, toluene, room temp., 4 h (96%); iv, MeCH<sub>2</sub>C(OEt)<sub>3</sub>, phenol, 165 °C, 4 h (90%); v, Bu<sup>n</sup><sub>4</sub>NF, tetrahydrofuran (THF), room temp., 2 h (85%); vi, p-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl, 4-N,N-dimethylaminopyridine, CH<sub>2</sub>Cl<sub>2</sub>. room temp., 2 h (82%).

<sup>‡</sup> We believe this intramolecular ester enolate alkylation scheme could be readily modified for the stereoselective synthesis of the grandisol skeleton.

(9)  $R^1 = CO_2Et, R^2 = Me$ 

(10)  $R^1 = Me_1 R^2 = CH_2 CH_2 OH$ 

(11)  $R^1 = CH_2CH_2OH_1R^2 = Me$ 

Scheme 2. Reagents: i, PhCOCl, pyridine, room temp., 12 h (90%); ii, SeO<sub>2</sub>, EtOH, reflux, 3 h, then NaBH<sub>4</sub>, 0°C, 2 h (62%); iii, MeCH<sub>2</sub>C(OEt)<sub>3</sub>, phenol, 165°C, 8 h (85%); iv, Triton B, THF, reflux, 1 h, then EtI, reflux, 30 min (70%); v, p-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl, 4-N,N-dimethylaminopyridine, CH<sub>2</sub>Cl<sub>2</sub>, room temp., 2 h (81%).

in our laboratory, 1 but afforded better yields, especially in the sterically demanding cases.

In summary, we have developed a stereoselective method for the construction of vicinally disubstituted cyclopentaneand cyclobutane-carboxylates which has wide ranging potential in organic synthesis along with our previously disclosed work on intramolecular alkylations to form six-membered rings.<sup>1</sup>

We thank the Korea Science and Engineering Foundation and S.N.U. Daewoo Research Fund for financial support. We are grateful to Dr. R. D. Clark (Syntex) for a sample of the parent acid of (9), and Professor A. I. Meyers (Colorado State University) for the <sup>1</sup>H n.m.r. spectrum of the methyl ester corresponding to (9).

Received, 18th January 1988; Com. 8/00147B
