

## Isolation and X-Ray Structure Determination of $[\text{Os}_4(\text{CO})_{12}(\text{C}_9\text{H}_6)]$ , an Indyne 'Butterfly' Cluster

Hong Chen, Brian F. G. Johnson, Jack Lewis,\* and Paul R. Raithby

University Chemical Laboratory, Lensfield Road, Cambridge CB2 1EW, U.K.

The cluster  $[\text{Os}_4(\text{CO})_{12}(\text{C}_9\text{H}_6)]$  (**1**) has been isolated from the reaction of  $[\text{Os}_3(\text{CO})_{12}]$  with indene in nonane under reflux; X-ray analysis has shown that (**1**) has a 'butterfly' metal framework while the indyne group interacts with the metal atoms *via* two  $\sigma$ -bonds and two  $\pi$ -bonds.

We have recently established a new face-capping bonding mode for benzene in the trimetallic clusters  $[\text{M}_3(\text{CO})_9(\mu_3\text{-}\eta^2\text{:}\eta^2\text{:}\eta^2\text{-C}_6\text{H}_6)]$  ( $\text{M} = \text{Ru}^1$  or  $\text{Os}^2$ ). Molecular structure determinations on these species have shown that this bonding mode bears a striking resemblance to the Kekulé type of distortion forms for benzene adsorbed on Rh (111)<sup>3</sup> and Os (001)<sup>4</sup> single crystal surfaces. It has also been reported<sup>5</sup> that when  $[\text{Ru}_3(\text{CO})_{11}(\text{PPh}_3)]$  is heated in toluene, one of the products is the pentanuclear cluster  $[\text{Ru}_5(\text{CO})_{13}(\mu_4\text{-PPh})(\mu_5\text{-}\eta^6\text{-C}_6\text{H}_4)]$  which contains a  $\mu_5$ -benzyne and which may be

**Figure 1.** The molecular structure of  $[\text{Os}_4(\text{CO})_{12}(\text{C}_9\text{H}_6)]$  (**1**) showing the atom numbering scheme; hydrogen atoms have been omitted for clarity. Bond lengths: Os(1)–Os(2) 2.747(3), Os(1)–Os(3) 2.737(2), Os(2)–Os(3) 2.883(3), Os(2)–Os(4) 2.735(3), Os(3)–Os(4) 2.760(3), Os(1)–C(1) 2.28(3), Os(1)–C(2) 2.25(3), Os(2)–C(2) 2.08(3), Os(3)–C(1) 2.19(3), Os(4)–C(1) 2.23(3), Os(4)–C(2) 2.25(3), C(1)–C(2) 1.47(5), C(1)–C(5) 1.40(5), C(2)–C(3) 1.65(4), C(3)–C(4) 1.48(5), C(4)–C(5) 1.41(4), C(4)–C(6) 1.24(5), C(5)–C(9) 1.47(4), C(6)–C(7) 1.37(7), C(7)–C(8) 1.50(7), C(8)–C(9) 1.27(6) Å; bond angles: Os(2)–Os(1)–Os(3) 63.4(1), Os(1)–Os(2)–Os(3) 58.1(1), Os(1)–Os(2)–Os(4) 92.5(1), Os(3)–Os(2)–Os(4) 58.8(1), Os(1)–Os(3)–Os(2) 58.5(1), Os(1)–Os(3)–Os(4) 92.2(1), Os(2)–Os(3)–Os(4) 57.9(1), Os(2)–Os(4)–Os(3) 63.3(1), Os(1)–C(1)–Os(3) 75.7(10), Os(1)–C(1)–Os(4) 123.3(16), Os(3)–C(1)–Os(4) 77.5(11), Os(1)–C(1)–C(2) 70.2(16), Os(3)–C(1)–C(2) 107.2(22), Os(4)–C(1)–C(2) 71.6(17), Os(1)–C(1)–C(5) 116.8(2), Os(3)–C(1)–C(5) 142.2(25), Os(4)–C(1)–C(5) 115.0(21), C(2)–C(1)–C(5) 110.6(27), Os(1)–C(2)–Os(2) 78.6(10), Os(1)–C(2)–Os(4) 123.4(13), Os(3)–C(2)–Os(4) 78.2(9), Os(1)–C(2)–C(1) 71.9(16), Os(2)–C(2)–C(1) 111.5(21), Os(4)–C(2)–C(1) 70.0(15), Os(1)–C(2)–C(3) 112.9(18), Os(2)–C(2)–C(3) 146.2(21), Os(4)–C(2)–C(3) 115.1(18), C(1)–C(2)–C(3) 102.4(25).

considered to serve as a model for the dissociative chemisorption at a step site on a metal (111) surface. The generation of benzyne by pyrolysis of a tertiaryphenylphosphine complex *via ortho*-metallation followed by P–C bond cleavage is not without precedent and has been observed on several other occasions.<sup>6</sup> There are relatively few examples of direct 'benzyne' formation from the appropriate arene precursor, the best characterised have been those derived from  $[\text{Os}_3(\text{CO})_{12}]$ .<sup>7</sup> In this communication we wish to report the synthesis and full characterisation of the cluster  $[\text{Os}_4(\text{CO})_{12}(\text{C}_9\text{H}_6)]$  (**1**) in which the arene unit,  $\text{C}_9\text{H}_6$ , has been shown to bond to a 'butterfly' arrangement of four osmium atoms in an indyne bonding mode.

The reaction of  $[\text{Os}_3(\text{CO})_{12}]$  with indene,  $\text{C}_9\text{H}_8$ , was carried out in nonane under reflux at 152 °C for 24 h. In addition to the major compound,  $[\text{Os}_3\text{H}_2(\text{CO})_9(\text{C}_9\text{H}_6)]$ ,<sup>8</sup> an orange band was separated on the silica plate, as a mixture. Two compounds,  $[\text{Os}_4(\text{CO})_{12}(\text{C}_9\text{H}_6)]$  (**1**)<sup>†</sup> and  $[\text{Os}_2(\text{CO})_6(\text{C}_9\text{H}_6)]$  [ $\text{MS}: m/z = 780$ ; IR (hexane): 2079m, 2049vs, 1999s, 1973s, 1943vw, br.] were then isolated as orange and yellow crystals, respectively, by slow evaporation of a  $\text{CH}_2\text{Cl}_2$ /hexane solution of the orange mixture at room temperature. The close similarity between the IR spectra of (**1**) and  $[\text{Os}_4(\text{CO})_{12}(\text{Ph}_2\text{C}_2)]$ <sup>9</sup> implies that (**1**) adopts the same 'butterfly' metal core structure as the latter species. The <sup>1</sup>H NMR spectrum of (**1**) in  $\text{CD}_2\text{Cl}_2$  shows a singlet at  $\delta$  4.52 for the  $\text{CH}_2$  unit, and in the phenyl region, two doublets ( $\delta$  7.42 and 7.20) and two apparent triplets ( $\delta$  7.32 and 7.05) for the remaining  $\text{C}_6\text{H}_4$  moiety, implying the asymmetry of the arene unit when bonding to the metal 'butterfly'.

A single crystal X-ray diffraction‡ study has confirmed this structure, which is shown in Figure 1, together with some important bond parameters. The four osmium atoms adopt a 'butterfly' configuration, while the arene moiety sits above the

<sup>†</sup> Spectroscopic data for complex (**1**): MS:  $m/z$  1218; IR:  $\nu_{\text{CO}}$  (hexane): 2098vw, 2079sh, 2072m, 2048s, 2041m, 2000m, 1973vw  $\text{cm}^{-1}$ ; <sup>1</sup>H NMR ( $\text{CD}_2\text{Cl}_2$ , 400 MHz, all  $J$  values in Hz)  $\delta$  7.42 (d,  $J$  7.5, 1H), 7.32 (t,  $J$  7.6, 1H), 7.20 (d,  $J$  7.6, 1H), 7.05 (t,  $J$  7.6, 1H), 4.52 (s, 2H).

<sup>‡</sup> Crystal data:  $\text{C}_{21}\text{H}_6\text{O}_{12}\text{Os}_4$ ,  $M = 1211.1$ , triclinic, space group  $P\bar{1}$  (No. 2),  $a = 9.633(6)$ ,  $b = 10.823(8)$ ,  $c = 11.761(8)$  Å,  $\alpha = 91.47(5)$ ,  $\beta = 90.68(5)$ ,  $\gamma = 99.78(5)^\circ$ ,  $U = 1207.8(14)$  Å<sup>3</sup>,  $D_c = 3.33$   $\text{g cm}^{-3}$ ,  $Z = 2$ ,  $F(000) = 1064$ , Mo- $K_\alpha$  radiation,  $\lambda = 0.71073$  Å,  $\mu = 210.69$   $\text{cm}^{-1}$ . Nicolet R3mV four-circle diffractometer, 3428 reflections collected,  $2\theta$  range 5–45°, semi-empirical absorption correction, 2901 unique reflections with  $F > 5\sigma(F)$ . Structure solved by direct methods (Os atoms) and Fourier difference syntheses. Refined by full-matrix least-squares with Os, O, and organic ligand C atoms anisotropic, H atoms AFIXed and refined with common isotropic temperature factors, converged  $R = 0.073$ ,  $R_w = 0.096$ . Atomic co-ordinates, bond lengths and angles, and thermal parameters have been deposited at the Cambridge Crystallographic Data Centre. See Notice to Authors, Issue No. 1.

hinge of the 'butterfly', forming two  $\sigma$ -bonds with the 'hinge' osmium atoms and two  $\pi$ -bonds with the 'wing-tip' atoms. The dihedral angle between the 'wing-tips' of the metal butterfly is  $115.9^\circ$ . The pseudo-octahedral  $M_4C_2$  core geometry has been observed previously in a number of osmium and ruthenium clusters where the organic ligand is derived from an alkene or an alkyne.<sup>10</sup> In these cases, as in (1), the organic group formally acts as a four-electron donor, and the electron count is consistent with there being seven electron pairs available for framework bonding, the characteristic count for a closo-octahedron under Wade's Rules.<sup>11</sup> The only previously structurally characterised cluster in which an organic ring system co-ordinates in this mode is  $[Ru_6(CO)_{11}(C_8H_{10})]$ ,<sup>12</sup> where one unsaturated bond of the octadiene occupies two vertices of the  $M_4C_2$  octahedron while the opposite C-C double bond  $\pi$ -bonds to one of the 'wing-tip' Ru atoms. In the ruthenium cluster,<sup>12</sup> the interaction with the framework may be considered as co-ordination of an alkene C-C double bond to the 'butterfly' metal framework. A related interaction is present in (1), here it is the unsaturated C-C bond of a five-membered ring which interacts with the metal framework. The C(1)-C(2) distance in (1) is similar to that found in alkene and alkyne substituted clusters,<sup>10</sup> but the high estimated standard deviations on the bond parameters within the five-membered carbon ring precludes a detailed analysis of the bonding.

We wish to thank Sino-British Friendship Scholarship Scheme for financial support to (H. C.).
