Experimental Section

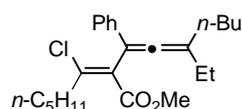

General. All reactions were performed at RT under air atmosphere in a round bottom flask equipped with magnetic stir bar. ^1H NMR (400 MHz) and ^{13}C NMR (100.6 MHz) spectra were recorded using a Bruker Avance 400 MHz NMR spectrometer (100 MHz for carbon) and respectively referenced to 7.27 and 77.0 ppm for chloroform-d solvent with TMS as internal standard. Mass spectra were recorded on a Shimadzu GCMS-QP5050A at an ionization voltage of 70eV equipped with a DB-WAX capillary column (internal diameter = 0.25 mm, length = 30 m). IR spectra were obtained as potassium bromide pellets or as liquid films between two potassium bromide pellets with a Bruker Vector 22 spectrometer. TLC was performed using commercially prepared 100-400 mesh silica gel plates (GF₂₅₄), and visualization was effected at 254 nm. Compounds **2d-2m** were produced according to literature by Sonogashira coupling. All the other chemicals were purchased from Aldrich Chemicals.

General procedure for the preparation of methyl 2-(1-chlorohexylidene)-5-ethyl-3-phenylnona-3,4-dienoate (**3ac**):

A test tube (10 mL) was charged with palladium chloride (10 mg, 0.056 mmol), LiCl (20 mg, 0.5 mmol), propargyl alcohol **2c** (108 mg, 0.5 mmol) and 0.5 mL 3N HCl. After the mixture was stirred for 2 min, alkynoate **1a** (77 mg, 0.25 mmol) was added, followed by the addition of PBU_3 (12 mg, 0.075 mmol). The reaction was carried out at RT for 12 h (monitored by TLC). The reaction mixture was taken up by in ether (10 mL) and washed with brine (10 mL). The organic layer was dried (MgSO_4), concentrated in vacuo and purified by flash silica gel chromatography using petroleum ether : ethyl acetate = 10:1 as eluant to give *Z*-**3ac** (33 mg in sum, 0.08 mmol, 32 %) and *E*-**3ac** (33 mg in sum, 0.08 mmol, 32 %) as yellow oils.
