Enantiopure...

... alleno-acetylenic macrocycles have been prepared and fully characterized. Their extraordinary intense circular dichroism (see picture) has been extensively studied and a mechanism for this remarkable response has been proposed. Additionally, the extent of the aromaticity was investigated by using the electron localization function. For more details see the Full Paper by F. Diederich, H. S. Rzepa et al. on page 9796 ff.
