

### Four banana-shaped ligands...

... and two square-planar coordinated metal ions assemble into a molecular cage that strongly binds bis-anionic guests. The uptake of rodlike guests leads to the formation of (pseudo)rotaxanes by either a slipping or clipping mechanism and can be reversibly switched by a change in pH. For more details, see the Communication by M. Shionoya and G. H. Clever on page 11792 ff.
