Star-shaped...

... oligo(thienylethynyl)benzenes have a multi-functionality like the Senjyu Kannon statue with thousands of hands and outstanding talent (see picture). These molecules show solvatochromic fluorescence, a marked redshift in emission and a fairly large two-photon absorption property, and fluorescent nano-structured polymorphs. For more details, see the Communication by M. Iyoda, K. Kamada et al. reported on page 12108 ff.
