

A CONVENIENT ALLYLATION OF ORTHO-QUINONES.  
AN EXTENSION ON THE UTILITY OF ALLYLTIN REAGENTS

Lewis acid catalyzed allylation of 1,2-naphthoquinones and o-benzoquinones with allyltributyltins gave monoallylation products in reasonable to high yields.

Introduction of an isoprenoid functionality into a quinone ring is an essential problem in the synthesis of isoprenoid quinones which play a pivotal role in the electron transport chain in both photosynthetic and respiratory processes.<sup>1)</sup> Several methods have been employed to synthesis of these biological active isoprenyl quinones.<sup>2)</sup> However, these methods remains fundamentally limited by the aspects of yields, regio- and stereoselectivity, and the difficulty of preparing a starting materials. Recently, we reported the direct introduction of allyl or prenyl group into p-quinones using allyltin reagents overcomes such limitations.<sup>3)</sup> Thus, coenzyme Q series, vitamin K series, and plastoquinone-1 were prepared satisfactorily by this method.<sup>3), 4)</sup> In addition, we revealed that the reaction appeared to proceed through allylquinol intermediates which underwent [1,2]rearrangement under influence of BF<sub>3</sub> to give allylhydroquinones.<sup>4)</sup> Since little is known about the allylation of o-quinones, extension of this allylating method to o-quinones will open an important route to the synthesis of natural products.

We wish to report here the allylation of 1,2-naphthoquinone and o-benzoquinones with allyltributyltin reagent in the presence of BF<sub>3</sub>OEt<sub>2</sub>. Thus, the reaction of allyltributyltins<sup>5)</sup> (2) with 1,2-naphthoquinones in dichloromethane gave allyl substituted 1,2-naphthalenediols (3) in fair to good yields (Scheme 1).

Typically the reaction was carried out by dropwise addition of an allyltributyltin (2) (0.6 mmol) to a stirred dichloromethane solution (10 ml) of quinone (1) (0.5 mmol) and BF<sub>3</sub>OEt<sub>2</sub> (0.75 mmol) under nitrogen at -78°C. After the addition, the resulting mixture was stirred continuously and allowed to stand at

(Scheme 1)

room temperature. The reaction was quenched by addition of 2N-HCl and products were extracted with ether. Since 4-allyl-1,2-naphthalenediols (3) were very air-sensitive, the dried ethereal extract was quickly concentrated by evaporator *in vacuo*, and treated with acetic anhydride-pyridine under nitrogen or otherwise treated with silver oxide to give quinones. Thus obtained diacetates or quinones were purified by preparative thin layer chromatography on silica gel (developing solvent: benzene). The products and their isolated yields are summarized in Table 1.

Marked contrast of the present reaction compared with those reported<sup>2)</sup> is exemplified in the allylation of 1,2-naphthoquinone. The reaction with  $\pi$ -2-methylallylnickel bromide complexes gave 2:1 mixture of the mono-(49%) and diallylated (29%) products. By the present method monoallylated product was afforded exclusively.

*o*-Benzoquinones also reacted with allyltributyltin to give the corresponding monoallylcatechols in very high yields (Table 1). Thus, *o*-benzoquinone, and its 4-methyl, and 4-*tert*-butyl derivatives produced the corresponding 5-allyl substituted catechols. In contrast, 3,5-dimethyl-*o*-benzoquinone afforded exclusively 4-allyl-3,5-dimethylcatechol. Remarkable thing is that halogen atoms and cyano group as the substituent on quinone ring are inert to this allylation.

To clarify the initial stage of the reaction of *o*-quinone with allyltin reagent, the reactions of 4-substituted 1,2-naphthoquinones and sterically hindered 3,5-di-*tert*-butyl-*o*-benzoquinone were examined. Thus, 4-cyano-1,2-naphthoquinone, 4-methoxy-1,2-naphthoquinone,<sup>6)</sup> and 3,5-di-*tert*-butyl-*o*-benzoquinone gave the corresponding 1,2-addition products to carbonyl in high yields, i.e., 4, 5, and 6 given in Table 1. In the allylation of 4-cyano-1,2-naphthoquinone the 1,2-addition took place at 2-carbonyl, but in that of 4-methoxy-1,2-naphthoquinone at 1-carbonyl, probably because of the influence of the mesomeric effect of the substituents. Therefore, initial site of the allylation may be governed with electron density of carbonyl carbon at position 1 or 2 of quinone.

Table 1. Alkylation of Ortho-quinones with Allyltributyltins

Quinone <sup>a</sup>	Allyltin	Product <sup>b</sup>	Yield <sup>c</sup> (%)
1,2-NQ	<u>2a</u>	4-Allyl-1,2-naphthalenediol	78 <sup>d</sup>
	<u>2b</u>	4-(2-Methyl-2-propenyl)-1,2-naphthalenediol	78 <sup>d</sup>
6-Bromo-1,2-NQ	<u>2a</u>	4-Allyl-6-bromo-1,2-naphthalenediol	68 <sup>d</sup>
	<u>2b</u>	4-(2-Methyl-2-propenyl)-6-bromo-1,2-naphthalenediol	61 <sup>d</sup>
3-Methoxy-1,2-NQ	<u>2a</u>	4-Allyl-3-methoxy-1,2-naphthalenediol	65 <sup>e</sup>
	<u>2b</u>	3-Methoxy-4-(2-methyl-2-propenyl)-1,2-naphthalenediol	79 <sup>e</sup>
3-Chloro-1,2-NQ	<u>2b</u>	3-Chloro-4-(2-methyl-2-propenyl)-1,2-naphthalenediol	89 <sup>e</sup>
4-Cyano-1,2-NQ	<u>2a</u>	<u>4</u>	87
4-Methoxy-1,2-NQ	<u>2a</u>	<u>5</u>	91
o-BQ	<u>2a</u>	4-Allylcatechol	62
4-Methyl-o-BQ	<u>2a</u>	4-Allyl-5-methylcatechol	93
4- <i>tert</i> -Butyl-o-BQ	<u>2a</u>	4-Allyl-5- <i>tert</i> -butylcatechol	93 <sup>d</sup>
3,5-Dimethyl-o-BQ	<u>2a</u>	4-Allyl-3,5-dimethylcatechol	85
3,5-di- <i>tert</i> -Butyl-o-BQ	<u>2a</u>	<u>6</u>	93

<sup>a</sup>1,2-NQ: 1,2-Naphthoquinone; o-BQ: o-Benzoquinone. <sup>b</sup>Characterized by infrared and nmr spectra after acetylation or oxidation to quinone. <sup>c</sup>Yields refer to isolated products, based on used quinone. <sup>d</sup>Yields after acetylation with acetic anhydride-pyridine. <sup>e</sup>Yields after oxidation with silver oxide.

In addition, we examined the reaction of 1,2-naphthoquinones with unsymmetrical allylic reagent, i.e., 2-butenyltributyltin,<sup>7)</sup> under the same reaction conditions (Scheme 2).

(Scheme 2)

When 4-cyano-1,2-naphthoquinone was treated with crotyltin reagent and quenched at  $-30^{\circ}\text{C}$ ,  $\alpha$ -adduct (1,2-addition product) (9) was obtained exclusively (isolated yield: 91%). This indicates that addition of allyltin reagent to carbonyl of 1,2-naphthoquinone occurs at the  $\alpha$  allyl terminus. However, 1,2-naphthoquinone and 6-bromo-1,2-naphthoquinone gave a mixture of rearranged products, 7 ( $\alpha$ -adduct) and 8 ( $\gamma$ -adduct) as shown in scheme 2, and their distributions were shown in Table 2. This is a quite interesting difference compared with the results in the reactions of p-quinones,<sup>4)</sup> but the due course of the reaction will be written in future.

Table 2. Reaction of 2-butenyltributyltin with 1,2-naphthoquinone<sup>a</sup>

Quinone	Product	Yield <sup>b</sup> (%)	Product distribution <sup>c</sup> (%)	
			$\alpha$ -adduct ( <u>7</u> )	$\gamma$ -adduct ( <u>8</u> )
1,2-Naphthoquinone	<u>7a</u> and <u>8a</u>	85	54	46
6-Bromo-1,2-naphthoquinone	<u>7b</u> and <u>8b</u>	91	73	27

<sup>a</sup>Reactions were performed in 0.5 mmol scale under standard conditions.

<sup>b</sup>Isolated yield after acetylation, based on used quinone.

<sup>c</sup>Determined by  $^1\text{H-NMR}$ .
