New methoxy-chalcone and flavanone derivatives were obtained by the methylation of the hydrolysis products of safflomin-A (1), a yellow component of the flowers of Safflower (*Carthamus tinctorius* L.). The formation of these derivatives significantly contributes to the elucidation of the structure of 1, proposed by us.

In a previous communication,<sup>1)</sup> we have reported the investigation of the structure of safflomin-A (1), a yellow pigment of the flowers of Safflower (*Carthamus tinctorius* L.). Now, we wish to report the formation of the new chalcone and flavanone derivatives, two isomers of safflomidin-A pentamethyl ether dianhydrides (2 and 3),<sup>2)</sup> 8-methoxycarbonylmethyl-4',5,6,7-tetramethoxyflavanone (4), and 3'-methoxycarbonylmethyl-2',4,4',5',6'-pentamethoxychalcone (5), by the methylation of the hydrolysis products of 1.

Scheme 1

A solution of 1 in dilute methanol containing hydrochloric acid was refluxed for 18 h. Most of methanol was removed *in vacuo* and the resulting crude aglycon<sup>3)</sup> was extracted with ethyl acetate to give an amorphous brownish yellow powder, which was methylated with dimethyl sulfate-potassium carbonate in acetone. The methylated products were separated by the repeated chromatography on columns of silica gel firstly with benzene-ethyl acetate (2:1) as eluent then with ether-petroleum ether (10:1) to afford four main components, A, B, C, and D.

Two isomeric structures (2 or 3) of safflomidin-A pentamethyl ether dianhydrides were respectively assigned for A and B on the basis of the following physical data.

A; mp 62-64°C, MS m/e 484 ( $M^+$ ), 335, 161, and 121,  $UV_{max}$  (EtOH) 327 and 260 (sh) nm. IR (KBr) 1635 and 1593  $cm^{-1}$  (C=O and C=C),  $^1H-NMR$  ( $CDCl_3$ )  $\delta$  7.46 and 6.88 (each 2H, d,  $J=8.5Hz$ , *p*-substituted phenyl), 7.23 and 6.90 (each 1H, d,  $J=16.0Hz$ , -CH=CH-), 6.86 (1H, s, -CH=), 4.10, 3.91, 3.86, 3.81, and 3.49 (each 3H, s, -OMe  $\times$  5), 4.86 (1H, d,  $J=6.0Hz$ ,  $C_3-H$ ), 3.3-4.3 (4H, m,  $C_{4,5,6}-H$ ).

B; mp 52-55°C, MS m/e 484 ( $M^+$ ), 335, 161, and 121,  $UV_{max}$  (EtOH) 327 and 255 nm, IR (KBr) 1636 and 1593  $cm^{-1}$  (C=O and C=C),  $^1H-NMR$  ( $CDCl_3$ )  $\delta$  7.47 and 6.89 (each 2H, d,  $J=8.5Hz$ , *p*-substituted phenyl), 7.27 and 6.91 (each 1H, d,  $J=16.0Hz$ , -CH=CH-), 6.87 (1H, s, -CH=), 4.11, 3.92, 3.87, 3.82, and 3.51 (each 3H, s, -OMe  $\times$  5), 4.97 (1H, d,  $J=6.0Hz$ ,  $C_3-H$ ), 3.3-4.3 (4H, m,  $C_{4,5,6}-H$ ).

In the  $^1H-NMR$  spectrum of the monoacetate of A, the downfield shift of the one of the four protons at 3.3-4.3 ppm ( $C_{4,5,6}-H$ ) into 5.3 ppm (m) shows the presence of a secondary hydroxyl group in A. Furthermore, the position of the hydroxyl group in A was established at  $C_5$ , because the above lower shifted signal at 5.3 ppm did not change when  $C_3$ -proton was irradiated. Similar structure can be also expected for compound B. The stereochemistry of these derivatives, A and B, remains undisclosed.

Scheme 2

The structures of C and D have subsequently been identified by the comparison with the synthetic samples, 4 and 5, respectively.

Compound C (4), mp 147-148°C, MS m/e 416 ( $M^+$ ), UV  $\lambda_{\max}$  (EtOH) 275 and 330 nm, IR (KBr) 1735 and 1670  $\text{cm}^{-1}$  (C=O),  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$  2.77 (1H, dd,  $J=17.0$  and 4.4Hz,  $\text{C}_3\text{-H}$ ), 3.02 (1H, dd,  $J=17.0$  and 12.0Hz,  $\text{C}_2\text{-H}$ ), 3.67 (5H, s,  $-\text{CH}_2-$  and  $-\text{OMe}$ ), 3.85, 3.88, 3.98, and 4.03 (each 3H, s,  $-\text{OMe} \times 4$ ), 5.37 (1H, dd,  $J=12.0$  and 4.4Hz,  $\text{C}_2\text{-H}$ ), 6.95 and 7.38 (each 2H, d,  $J=8.5\text{Hz}$ , *p*-substituted phenyl).

Compound D (5), viscous oil, MS m/e 430 ( $M^+$ ), UV  $\lambda_{\max}$  (EtOH) 330 nm, IR ( $\text{CHCl}_3$ ) 1730 and 1630  $\text{cm}^{-1}$  (C=O),  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$  3.66 (3H, s,  $-\text{OCOMe}$ ), 3.71 (2H, s,  $-\text{CH}_2-$ ), 3.81, 3.83, and 3.88 (each 3H, s,  $-\text{OMe} \times 3$ ), 3.93 (6H, s,  $-\text{OMe} \times 2$ ), 6.90 and 7.40 (each 1H, d,  $J=16.0\text{Hz}$ ,  $-\text{CH}=\text{CH}-$ ), 6.88 and 7.50 (each 2H, d,  $J=8.5\text{Hz}$ , *p*-substituted phenyl).

The synthetic methods of these compounds from 6<sup>4)</sup> or 11<sup>4)</sup> are shown in Scheme 2.<sup>5)</sup> Methylation of 10 with dimethyl sulfate-potassium carbonate in acetone didn't give chalcone 5. Attempt to prepare 5 from 3'-cyanomethyl-2',4,4',5',6'-pentamethoxy-chalcone (16) was also unsuccessful, because of the great difficulty of its hydrolysis.

Another flavanone isomer 17 different from 4 was obtained by the esterification of 15 with diazomethane in ether. Finally, compound 5 was obtained by the methylation of 15, prepared from 11.

The formation process of A, B, C, and D are assumed as follows (Scheme 3).

Scheme 3

Dehydration of two moles of water from the aglycon (18) give two safflomidin-A dianhydride isomers (19 and 20), which are methylated to afford 2 or 3, respectively. On the other hand, dehydration of one mole of water gives safflomidin-A monoanhydride (21), which forms carbonyl compound 22 by the addition of one mole of water. Oxidative degradation of 22 during the prolonged hydrolysis gives a mixture 23 and 24, which are methylated to afford compound 4 or 5, respectively.

The structure of safflomin-A previously proposed by us is further supported from the formation of the derivatives of the hydrolysis products described in this paper.

The authors wish to express their thanks to Dr. Yutaka Fujise of Tohoku University for obtaining the  $^1\text{H-NMR}$  spectra of compound A and B. This work was supported by a Grant-in-Aid for Scientific Research from the Ministry of Education, Science and Culture.
