Syntheses of vinyl ketones and the himachalene skeleton from  
4-phenylthio-N,N -dimethylaminobutyronitrile were demonstrated.

Much attention has been devoted to the development of a 3-carbon fragment as  $\beta$ -acylvinyl anion and homoenolated anion equivalents.<sup>1)</sup> Several applications of the synthon have been demonstrated.<sup>1,2)</sup> In This communication we wish to report the utilization of the new reagent 1, 4-phenylthio-2-N,N -dimethylaminobutyronitrile,<sup>3)</sup> as an acyl anion equivalent<sup>4)</sup> 2.

The lithio compound 3 was generated by the reaction of 1 with lithium diisopropylamide (LDA) in tetrahydrofuran (THF) at  $-78^{\circ}\text{C}$ . The anion 3 could undergo alkylation with halides, 1,2- and 1,4-additions to carbonyl and  $\alpha,\beta$ -unsaturated carbonyl compounds, respectively, to give adducts which upon hydrolysis gave the corresponding  $\gamma$ -keto sulfides<sup>5)</sup> in good yield (Scheme 1).

Scheme 1.

It was found that the yields of  $\gamma$ -keto sulfides could be optimized by using 2.0 to 2.5 equivalents of LDA. The  $\gamma$ -keto sulfides were oxidized by either sodium metaperiodate or m-chloroperbenzoic acid (MCPBA) to give the corresponding labile  $\gamma$ -keto sulfoxides which upon pyrolysis gave vinyl ketones in high yields.<sup>6)</sup> It was found that with low boiling vinyl ketones, the best method to obtain the pure vinyl ketones was to pyrolyze the  $\gamma$ -keto sulfoxides under reduced pressure and the products were trapped in a Dry Ice-acetone bath (Method 1). For higher boiling vinyl ketones, the addition of calcium carbonate<sup>5)</sup> to the pyrolytic mixtures gave products which could be easily purified by preparative layer chromatography (PLC) (Method 2). The results are summarized in Table 1.

Table 1. Reaction of 3 with electrophiles and the synthesis of vinyl ketones

Entry	Electrophiles	$\gamma$ -Keto sulfides <sup>a)</sup> /%	Vinyl ketones <sup>a)</sup> /%
1	n-C <sub>4</sub> H <sub>9</sub> Br	<u>4</u> , R = n-C <sub>4</sub> H <sub>9</sub> -, 95 <sup>f)</sup>	<u>5</u> , R = C <sub>4</sub> H <sub>9</sub> -, 94 <sup>b)</sup>
2	 CH <sub>2</sub> Br	<u>4</u> , R =  , 87 <sup>f)</sup>	<u>5</u> , R =  , 83 <sup>b)</sup>
3	PhCH <sub>2</sub> Br	<u>4</u> , R = PhCH <sub>2</sub> -, 61 <sup>f)</sup>	<u>5</u> , R = PhCH <sub>2</sub> -, 81 <sup>b)</sup>
4	Cyclohexanone	<u>6</u> , 73 <sup>g)</sup>	<u>7</u> , 93 <sup>b)</sup>
5	Cyclohexenone	<u>8</u> , 63 <sup>f)</sup>	<u>9</u> , 56 <sup>c)</sup>
6	Cyclopentenone	<u>8</u> , 64 <sup>f)</sup>	<u>9</u> , 53 <sup>c)</sup>
7	n-C <sub>8</sub> H <sub>17</sub> Br	<u>8</u> , C <sub>8</sub> H <sub>17</sub> -, 81 <sup>f)</sup>	<u>5</u> , R = C <sub>8</sub> H <sub>17</sub> -, 89 <sup>b,d)</sup>
8	n-C <sub>9</sub> H <sub>19</sub> Br	<u>8</u> , C <sub>9</sub> H <sub>19</sub> -, 74 <sup>f)</sup>	<u>5</u> , R = C <sub>9</sub> H <sub>19</sub> -, 93 <sup>b,e)</sup>
9	n-C <sub>11</sub> H <sub>23</sub> Br	<u>8</u> , C <sub>11</sub> H <sub>23</sub> -, 73 <sup>f)</sup>	<u>5</u> , R = C <sub>11</sub> H <sub>23</sub> -, 82 <sup>c,e)</sup>
10	n-C <sub>13</sub> H <sub>27</sub> Br	<u>8</u> , C <sub>13</sub> H <sub>27</sub> -, 71 <sup>f)</sup>	<u>5</u> , R = C <sub>13</sub> H <sub>27</sub> -, 89 <sup>c,e)</sup>
11	CH <sub>2</sub> =CH(CH <sub>2</sub> ) <sub>8</sub> CH <sub>2</sub> Br	<u>8</u> , CH <sub>2</sub> =CH(CH <sub>2</sub> ) <sub>8</sub> CH <sub>2</sub> -, 70 <sup>f)</sup>	<u>5</u> , R = CH <sub>2</sub> =CH(CH <sub>2</sub> ) <sub>8</sub> CH <sub>2</sub> -, 82 <sup>c,e)</sup>

a) Electrophiles were added to a solution of 3 (1 equiv.) in THF and hexamethylphosphoramide (40:1 V/V) at -78 °C (for carbonyl compounds, 1 equiv. of ZnCl<sub>2</sub> was added). The mixture was slowly warmed to room temp. and then stirred overnight. The reaction was quenched with saturated aq. ammonium chloride and the product was isolated with CHCl<sub>3</sub>. The crude adduct was hydrolyzed with 2M HCl (Method 3) or CuSO<sub>4</sub>·5H<sub>2</sub>O in ethanol (Method 4).<sup>7)</sup> The products,  $\gamma$ -keto sulfides, were purified by PLC with CHCl<sub>3</sub> as the mobile phase. The oxidation of  $\gamma$ -keto sulfides was conveniently effected with MCPBA in dichloromethane at -78 °C for 10 min. The resulting  $\gamma$ -keto sulfoxides were immediately pyrolyzed by either Method 1 or 2. b) Pyrolysis by Method 1. c) Pyrolysis of Method 2. d) The vinyl ketone was isolated from *Dictyopteris plagiogramma*.<sup>8)</sup> e) Substances secreted by soldiers of the termite *Cortaritermes silvestri*.<sup>9)</sup> f) Hydrolysis by Method 3. g) Hydrolysis by Method 4.

Attempts to generate the dianion 10 by using excess LDA or n-BuLi in the presence of either diazabicyclo[2.2.2]octane (DABCO) or N,N,N',N'-tetramethylethylenediamine (TMEDA)<sup>10)</sup> were unsuccessful. Only mono-anion 3 was formed as indicated by deuteration and alkylation (with methyl iodide) experiments.

The synthetic potential of the new three-carbon unit was further demonstrated by the synthesis of himachalene<sup>11)</sup> ring skeleton. Alkylation of 3 with 12<sup>12)</sup> (Scheme 2) according to the procedure described previously gave the expected 13 in 84% yield. Oxidation of 13 with MCPBA at  $-78^{\circ}\text{C}$  in dichloromethane followed by pyrolysis in carbon tetrachloride in the presence of calcium carbonate gave 14 directly in 71% yield (from 13).

Our results demonstrated that 1 can be utilized effectively as the anion equivalent 2. Further exploratory work is in progress.

Scheme 2.
