(Received September 5, 1995)

Phosphonium salts, PPh<sub>4</sub>I and PMePh<sub>3</sub>I, oxidatively add to Pd(methyl acrylate)(PMePh<sub>2</sub>)<sub>2</sub> to give *trans*-[PdPhI(PMePh<sub>2</sub>)<sub>2</sub>] in moderate yields with cleavage of the P-phenyl bond. Conversely thermolysis of *trans*-PdPhIL<sub>2</sub> (L = PMePh<sub>2</sub> and PPh<sub>3</sub>) reductively eliminates PMePh<sub>3</sub>I and PPh<sub>4</sub>I, respectively. Application of the P-C bond cleavage process in phosphonium salts to olefination, carbonylation and hydrogenation reactions has been explored.

The objectives of the present study are twofold: one is to explore the applicability of the P-C bond cleavage reaction to organic synthesis and the other is to clarify the reason for the occurrence of an unwanted side reaction in Heck type reaction (olefination of aryl halides) to cause involvement of the phenyl group in PPh<sub>3</sub> ligand into the product olefin (Eq. 1). <sup>1,2</sup> Formation of the undesired product was accounted for by internal exchange of the aryl ligand in the intermediate complex with the phenyl group in the PPh<sub>3</sub> ligand (Eq. 2). <sup>3</sup> We considered an alternative route to the exchange process involving the reductive elimination of aryl halide and its subsequent combination with the PPh<sub>3</sub> to give quaternary phosphonium salt. <sup>4</sup> Oxidative addition of the phosphonium salt with the coordinatively unsaturated Pd(0) species with cleavage of the P-phenyl bond would produce a phenylpalladium halide complex (Eq. 3).

$$Ar-X + Y \xrightarrow{Pd-catalyst} Ar Y + Ph$$

$$Ph-PPh_2 \text{ Internal exchange } Ar-PPh_2$$

$$Ar-Pd-X \xrightarrow{Ph-Ph_3} Ph-Pd-X (2)$$

$$PPh_3 \qquad PPh_3$$

$$Ar-Pd-X \xrightarrow{Ph-Ph_3} Ph-Pd-X (3)$$

$$PPh_2 \qquad Ph-Pd-X (3)$$

$$PPh_3 \qquad Ph-Pd-X (3)$$

$$PPh_3 \qquad Ph-Pd-X (3)$$

$$PPh_3 \qquad Ph-Pd-X (3)$$

$$PPh_3 \qquad Ph-Pd-X (3)$$

In fact treatment of a coordinatively unsaturated Pd(0) complex, Pd(methyl acrylate)(PPh2Me)2 2, with PMePh3I at 60 °C induced the cleavage of the P-phenyl bond in the phosphonium salt to produce trans-[PdPhI(PMePh<sub>2</sub>)<sub>2</sub>] 3 in 52% yield. Similarly the reaction of 2 with PPh I gave 3 in 57% yield (Scheme 1). Complex 3 can be prepared also by the reaction of 2 with phenyl iodide. Thermolysis of 3 at 80 °C in CD<sub>3</sub>CN liberated PMePh<sub>3</sub>I and palladium black containing unidentified species having the PMePh, ligand. Similar behavior can be observed with PPh<sub>3</sub>-coordinated palladium complexes. Thus, trans-[PdPhI(PPh<sub>3</sub>)<sub>2</sub>] 4, which can be prepared by oxidative addition of phenyl iodide with Pd(PPh<sub>3</sub>)<sub>4</sub>, liberates ca. 30% of PPh<sub>4</sub>I by refluxing 4 in CH<sub>2</sub>Cl<sub>2</sub>. Conversely, treatment of Pd(dba)<sub>2</sub> (dba = dibenzylideneacetone) with PPh<sub>4</sub>I in CH<sub>2</sub>Cl<sub>2</sub> in a 1 : 1 ratio at room temperature, as monitored by <sup>31</sup>P-NMR, formed the known phenylpalladium complex 5<sup>6</sup> in 54% yield. The phenylpalladium complex 5 can be also prepared in 75% yield by treatment of Pd(dba)<sub>2</sub> with 1 equiv. of PhI in the presence of 1

Ph<sub>2</sub>MeP Et Pd 
$$\frac{CO_2Me}{dioxane, 50 °C}$$
 Ph<sub>2</sub>MeP  $\frac{Pd^{UUU}}{Ph_2MeP}$  CO<sub>2</sub>Me  $\frac{Ph_2MeP}{Ph_2MeP}$  Pd  $\frac{Pd^{UUU}}{Ph_2MeP}$  Ph<sub>2</sub>MeP  $\frac{Pd^{UUU}}{Ph_2$ 

equiv. of PPh<sub>3</sub> in CH<sub>2</sub>Cl<sub>2</sub> at room temperature with concomitant formation of PPh<sub>4</sub>I (11%). The dimeric complex 5 containing one PPh<sub>3</sub> ligand per palladium seems to be more susceptible than 4 having two PPh<sub>3</sub> ligands to loss of the phosphonium salt PPh<sub>4</sub>I. Refluxing 5 in CH<sub>2</sub>Cl<sub>2</sub> liberated PPh<sub>4</sub>I in 92% yield.

$$\begin{array}{c} PPh_{3} & CH_{2}Cl_{2} \\ Pd(PPh_{3})_{4} + PhI & Ph \\ \hline & -2PPh_{3} & Ph \\ \hline & PPh_{3} & CH_{2}Cl_{2} \\ PPh_{3} & & & \\ \hline & & & \\ PPh_{3} & & & \\ \hline & & & \\ Pd(dba)_{2} + PPh_{3} + PhI & Ph \\ \hline & & & \\ PPh_{3} & & & \\ \hline & & & \\ Pd(dba)_{2} & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & & \\ \hline & & & \\ Ph & & & \\ \hline & & & \\ Ph & & & \\ \hline & & & \\ Ph & & & \\ \hline & & & \\ Ph & & & \\ \hline & & & \\ Ph & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & & \\ Ph & & \\ \hline & & \\ Ph &$$

Upon finding the ready cleavage of the P-aryl bond in the phosphonium salt on its interaction with Pd(0) complexes we explored the applicability of the P-C bond cleavage reaction to organic synthesis. Treatment of quaternary phosphonium salt  $PRPh_3I$  (R = Me or Ph) with methyl acrylate and triethylamine in the presence of Pd(PPh<sub>3</sub>)<sub>4</sub> (10 mol%) in dioxane at 140 °C gave methyl cinnamate in 36% (R = Me) and 32% (R = Ph) yields, respectively (Eq. 4).

The aryl group in PRAr<sub>3</sub>I can be carbonylated in the presence of a palladium catalyst and an amine to give an amide 6 in excellent

**Table 1**. Palladium-Catalyzed Carbonylation of Quaternary Phosphonium Salts.<sup>a</sup>

Run	R	Ar	X	Yield of 6 /%	Yield of 7 /%
$1^b$	Ph	Ph	Ι	< 7	10
$2^{c}$	Ph	Ph	Cl	96	trace
3 <sup>c</sup>	Ph	Ph	Br	99	trace
4 <sup>c</sup>	Ph	Ph	Ι	67	trace
5 <sup>d</sup>	Me	<i>p</i> -Tol	I	< 10	
6 <sup>c</sup>	Me	Ph	I	79	

<sup>&</sup>lt;sup>a</sup>All the yields were determined by GLC except for run 1 and 4, where the yields were determined by isolation.

Catalyst used: <sup>b</sup>PdCl<sub>2</sub>(PPh<sub>3</sub>)<sub>2</sub> (5 mol%). <sup>c</sup>Pd(PPh<sub>3</sub>)<sub>4</sub> (10 mol%).

to good yields and an  $\alpha$ -keto amide 7 in low yields (Eq. 5 and Table 1).

$$PRAr_{3}X + CO \xrightarrow{\text{Pd-catalyst}} \frac{\text{Pd-catalyst}}{\text{dioxane, } 130 ^{\circ}\text{C}} \xrightarrow{\text{ArCNEt}_{2}} + \text{ArCCNEt}_{2} \\ \text{Et}_{2}\text{NH, - PRAr}_{2} \xrightarrow{\text{6}} 7$$

It is noteworthy that the reactivities of  $PPh_4X$  (X=I, Br, and Cl) in the carbonylation reaction are independent of the nature of X, whereas those of ArX are significantly dependent on X (reactivity:  $I\sim Br>>Cl$ ).

As an application of the P-C bond cleavage in the phosphonium salts combined with hydrogenation we examined the feasibility of preparation of mixed tertiary phosphines catalyzed by palladium catalysts (Eq. 6 and Table 2). Various phosphonium salts PRPh<sub>3</sub>I can be prepared readily by treatment of PPh3 with alkyl and alkenyl iodides. Palladium-catalyzed hydrogenation of the phosphonium in the presence of diethylamine afforded alkyldiphenylphosphines as shown in Table 2. The reaction proceeds only in the presence of palladium catalysts and amine. In these cases, preferential cleavage of the P-aryl bond over the Palkyl bond is recognized, although P-allyl and P-1-propenyl bonds are more reactive than P-aryl bonds (see run 5 and 6 in Table 2). The phosphonium salts, PiPrPh<sub>3</sub>I and PnBuPh<sub>3</sub>I, show lower reactivity, possibly because of steric reasons (see run 7 and 8 in Table 2). Further substitution of the tertiary phosphine PRPh, with an alkyl group(s) caused decrease in reactivity of the phosphonium salts. No reaction was observed when PMe<sub>2</sub>Ph<sub>2</sub>I or PMe<sub>3</sub>PhI was employed.

PPh<sub>3</sub> + R-I
