This communication describes the electrolytic methoxylation of secondary and tertiary  $\gamma$ -furylalkanoles containing a methyl group in position 5 of the furan ring and also in certain cases the gem-dimethyl group at the first carbon atom from the ring in the side chain. During this process previously unknown derivations of 2-methyl-2-methoxy spirononenes were obtained. Catalytic hydrogenation of the latter at room temperature leads mainly to the formation of the corresponding spirononane and the tetrahydrofuranic ketone, which indicates that hydrogenolysis readily proceeds at the carbon-oxygen bonds.

The reaction of intramolecular electrolytic alkoxylation of the 1-( $\alpha$ -furyl) 3-alkanols leads to the formation of 2-methoxy-1,6-dioxaspiro[4.4]non-3-ene and its homologs [2, 3]. More complex systems of a similar type may also be obtained [4-7]. It has been established [2, 3, 5, 6] that 2-methoxy-1,6-dioxaspiro [4.4]non-3-ene, and its homologs containing alkyl radicals in position 7 of the spirane ring, incorporate hydrogen at the double bond during catalytic hydrogenation over Raney nickel at room temperature and are converted into the corresponding 2-methoxy-1,6 dioxaspiro[4.4]nonanes with yields of 80-90%, and at 120° C undergo hydrogenolysis at the  $\text{CH}_3\text{O}-\text{C}$  bond to form the corresponding 1,6-dioxaspiro[4.4]nonanes. Other methods for obtaining the latter compounds have been described [8-13].

Synthesis of the polyalkyl-substituted spiranes of the 2-methoxy-1,6-dioxaspiro[4.4]non-3-ene group, described in this report was used for further study of the substitution reaction in this series. In addition, in relation to the well-known factors concerning the effect of the accumulation of alkyl radicals in the aliphatic chain on the processes of ring formation [12-15, 23], it was of great interest to determine to what extent these structural characteristics affect the electrochemical process of the formation of 2-methoxy-1,6-dioxaspiro[4.4]non-3-ene, and also to what extent they affect properties of the latter

1-(5-Methyl-2'-furyl)-3-butanone (I), 2-(5'-methyl-2'-furyl)-2-methyl-4-pentanone (II), 1-(5'-methyl-2'-furyl)-3-butanol (III), 2-(5'-methyl-2'-furyl)-2-methyl-3-pentanol (IV), 2-(5'-methyl-2'-furyl)-2,4-dimethyl-4-hexanol (V), 1-(5'-methyl-2'-furyl)-3-methyl-3-butanol (VI), 1-(5'-methyl-2'-furyl)-3-methyl-3-pentanol (VII), 2-(5'-methyl-2'-furyl)-2,4-dimethyl-4-

pentanol (VIII), and 2-(5'-methyl-2'-furfuryl)-cyclopentanol (IX) were obtained for the above-mentioned synthesis by methods described in the experimental part of the report. By electrolytic alkoxylation of the above alcohols in methanol, it was possible to synthesize the polyalkyl-substituted 2-methoxy-1,6-dioxaspiro[4.4]non-3-enes according to the scheme:

By this method 2-methoxy-2,7-dimethyl-(X), 2-methoxy-2,7,7-trimethyl-(XI), 2-methoxy-2,7-dimethyl-7-ethyl-(XII), 2-methoxy-2,7,9,9-tetramethyl-(XIII), 2-methoxy-2,7,7,9,9-pentamethyl-(XIV) and 2-methoxy-2,7,9,9-tetramethyl-7-ethyl-1,6-dioxaspiro[4.4]non-3-ene (XV) were obtained (Table 1). Spiro[3H-cyclopentafuran-2,2'-(5'-methoxy-5'-methyl) furan] (XVI) was formed from compound IX [6].

Assuming that the yields of the above products to a certain extent characterize the ease of ring formation, it can be seen that yields of compounds X, XI and XVI were 62-68%, i. e., approximately the same as those (63-76%) for the 7-alkyl- and 7,7-dialkyl-substituted spirononenes obtained previously [2, 3]. However, even for the trialkyl-derivative XII the yields increase to 82% and reach 82-95% for the tetra- and pentaalkyl-derivatives XIII-XV which contain the 9,9 gemdimethyl group. One should note that 2-methoxy-1,6-dioxaspiro[4.4]non-3-ene is formed from 1-( $\alpha$ -furyl)-3-propanol, unsubstituted in the side chain with a yield of 53% [2, 3].

From the above fact one may conclude that ring formation under the conditions of electrolysis proceeds more readily in compounds with a branched chain, especially in the presence of the hema-dimethyl groups. This conclusion is in agreement with previous reports [12, 15, 23].

If the presence of the methyl group in position 5 of the furan ring in the alcohols has no marked effect on the formation of 2-methyl-2-methoxy-1,6-dioxaspiro[4.4]non-3-enes, the properties of the latter are essentially dependent on this condition. For example, catalytic hydrogenation of similar systems over Raney nickel at room temperature leads to the formation of

\* For part XXXV, see [1].

several products:

In all previously studied cases [2, 3, 5, 6] under these conditions the reaction proceeded only in direction **a**, (i. e., it was limited by the hydrogenation of the double bond). On hydration of **X–XII** and **XVI** where  $R = R' = H$ , methoxyspiroonane (direction **a**) either is not formed at all or is present in an insignificant amount (**X**). The corresponding spiroonane and tetrahydrofuran ketone are formed in approximately equal quantities from compounds **XI** and **XVI**. Mainly spiroonane and a small quantity of ketone are formed from compound **XII**. The total yield of the products was 62–88%.

Thus in all cases examined the main directions are **b** and **c**, i. e., not only hydrogenation of the double bond but also hydrogenolysis.

Reaction **b**, which comprises the hydrogenolysis of bond  $\text{CH}_3\text{O}-\text{C}$  and the formation of the ketone is apparently the result of hydrogenolysis at the  $-\text{O}_1-\text{C}_5$  bond and subsequent cleavage of a molecule of methyl alcohol from the arising semiacetal:

The above account indicates that there is a marked weakening of the  $\text{CH}_3\text{O}-\text{C}$  and  $-\text{O}_1-\text{C}_5$  bonds in the spiroonanes of the above mentioned structure in comparison with analogous compounds not containing a methyl radical in position 2 [2, 3]. In addition, it is of interest to note that, under the same conditions, hydrogenation of compound **XIII**, which differs from **XI** and **XII** only by the presence of the gem-dimethyl group in position 9, leads to the formation of the corresponding methoxyspiroonane (**XIII**) with a yield of 83% and a small quantity of spiroonane (**XXIV**).

This is of interest in relation to the question concerning the laws in subsequent catalytic transformations of furan derivatives during hydrogenation of the compounds on nickel, which, in accordance with the principle of energetic conformation, proceed with more difficulty the higher their energetic barrier, calculated from the mean bond energies [16, 17]. However, structural characteristics of the molecule cause the value of the latter to fluctuate within large limits as it does in the case examined.

The UV and IR spectra provide frequent confirmation of the structure of the tetrahydrofuran ketones. An intensive band in the spectrum at  $1725-1728\text{ cm}^{-1}$  corresponds to the frequency of the valency oscillation of the  $\text{C}=\text{O}$  bond of the ketones. The presence of the

tetrahydrofuran ring is confirmed by the  $1088\text{ cm}^{-1}$  frequency, characterizing the valency oscillation of the  $\text{C}-\text{O}-\text{C}$  bond of tetrahydrofuran [18]. The position and intensity of the maximum absorption in the UV spectra ( $\lambda_{\text{max}} 285\text{ nm}$ ,  $\log_{\epsilon} 1.84$  in methanol;  $\lambda_{\text{max}} 289\text{ nm}$ ,  $\log_{\epsilon} 1.7$  in isoctane) and the bathochromic effect on transfer from methanol to isoctane also provide evidence for the presence of the ketone group in the compounds **XIX**, **XXI**, and **XXVII**. Compounds **VI**, **VII**, **X–XV**, **XVII**, **XIX–XXIII**, **XXV–XXVII** were obtained for the first time.

## EXPERIMENTAL\*

Ketone **I** was obtained on hydrogenation of 5-methylfurfurylidene acetone in the presence of Raney nickel. Hydrogenation was conducted in a rotating steel autoclave at room temperature in a medium of methyl alcohol and at an initial hydrogen pressure of 120 atm, and was terminated by the absorption of a calculated quantity of hydrogen. Yield was 76%, which exceeds the yield of this ketone by the well-known methods [19]. bp  $96-97^{\circ}\text{C}$  (11 mm);  $d_4^{20} 1.009$ ;  $n_D^{20} 1.4720$ . Found: C 70.88, 71.07; H 8.00, 7.73; MR<sub>D</sub> 46.26. Calculated for  $\text{C}_9\text{H}_{12}\text{O}_2$ , %: C 71.03; H 7.95; MR<sub>D</sub> 42.28. According to data in the literature [19], bp  $97-98^{\circ}\text{C}$  (12 mm).

The ketone **II** and furanic alcohols **III**, **IV**, **V** and **IX** were synthesized according to methods described in the literature [6, 9, 13, 20].

The furanic alcohols **VI** and **VII** were obtained from compound **I** and methyl- and ethylmagnesium bromide respectively with yields of 83 and 77%.

Compound **VI**: Bp  $98-100^{\circ}\text{C}$  (7 mm);  $d_4^{20} 0.9925$ ;  $n_D^{20} 1.4749$ . Found, %: C 71.01, 70.92; H 9.79, 9.35. MR<sub>D</sub> 47.71. Calculated for  $\text{C}_{10}\text{H}_{16}\text{O}_2$ , %: C 71.39; H 9.59; MR 48.41.

Compound **VII**: bp  $106-107^{\circ}\text{C}$  (7 mm);  $d_4^{20} 0.9830$ ;  $n_D^{20} 1.4788$ . Found, %: 72.30, 72.05; H 9.96, 9.71. MR<sub>D</sub> 52.57. Calculated for  $\text{C}_{11}\text{H}_{18}\text{O}_2$ , %: C 72.49; H 9.96; MR<sub>D</sub> 53.03.

Compound **VIII** was prepared from compound **II** and methyl magnesium bromide [24]. Yield was 75.5%; bp  $91-93^{\circ}\text{C}$  (7 mm);  $d_4^{20} 0.9618$ ;  $n_D^{20} 1.4730$ . Found, %: C 73.46, 73.43; H 9.87, 9.65. MR<sub>D</sub> 57.25. Calculated for  $\text{C}_{12}\text{H}_{20}\text{O}_2$ , %: C 73.43; H 10.27; MR<sub>D</sub> 57.65.

Electrolytic alkylation of the  $\gamma$ -furylalkanols was conducted in an electrolyzer with a nickel cathode and carbon anode, the arrangement of which has been described previously [21, 22].

**2-Methoxy-2,7-dimethyl-1,6-dioxaspiro[4.4]non-3-ene (X).** A 73 g quantity of freshly prepared furanic alcohol **III** and 5 g of ammonium bromide were dissolved in 220 ml of methyl alcohol and transferred to the electrolyzer. Electrolysis was conducted at a temperature of  $-15^{\circ}\text{C}$  with a current of 4–2 A and a voltage of 10–12 V. When electrolysis was complete, the solution was treated with sodium methoxide (1.2 g metallic sodium in 20 ml methyl alcohol). The methyl alcohol and ammonia were removed by distillation in a water bath at reduced pressure, and the precipitate of sodium bromide was removed by filtration and washed with ether. After removing the ether, the residue was distilled under vacuum.

The electrolytic methoxylation of the furanic alcohols (**IV–IX**) was conducted by a similar method, as a result of which 1,6-dioxaspiro[4.4]non-3-enes (**XI–XV**) (Table 1) and also spiro[3H-cyclopentafuran-2,2-(5-methoxy-5-methylfuran)] (**XVI**) [6] were obtained; bp was  $99-100^{\circ}\text{C}$  (5 mm);  $n_D^{20} 1.4761$ ; yield, 68%.

Data concerning the conditions of electrolysis of the solutions of furanic alcohols are presented in Table 2.

In the IR spectra of the methoxyalkylspiroonanes there is a frequency of valence oscillation of the  $\text{C}=\text{C}$  bond of  $1640\text{ cm}^{-1}$ . The presence of the methoxyl group is confirmed by the frequency of  $2832\text{ cm}^{-1}$ . The gem-dimethyl group is characterized by the double bond  $1372-1385\text{ cm}^{-1}$ .

\* With the participation of T. I. Gubina.

Table 2  
Conditions of Electrolysis of the  $\gamma$ -Furylalkanols

$\gamma$ -Furyl-alkanols	Quantity of original substance	Current, A	Voltage, V	Temperature in the electrolyzer, C
III	0.47	4-3	9-21	-15
IV	0.29	4-3	8-18	-23
V	0.25	4-3	11-18	-23
VI	0.34	4-3.5	8-20	-13
VII	0.23	4-2.5	9-18	-20
VIII	0.20	4-3	10-15	-20

Hydrogenation of compounds X-XVI was conducted in rotating steel autoclaves at room temperature in a medium of absolute methyl alcohol at an initial hydrogen pressure of 100-120 atm. Raney nickel at a concentration of 10% in relation to the weight of the substance was used as the catalyst. Hydrogenation was completed when hydrogen ceased to be absorbed. Usually the quantity of absorbed hydrogen was equivalent to 1.5-2 mole/mole substance.

The following compounds were obtained from X during hydrogenation under these conditions. **2-Methoxy-2, 7-dimethyl-1, 6-dioxaspiro[4.4]nonane (XVII)** with a yield of 15.5%; bp 89-91° C (17 mm);  $d_4^{20}$  1.0160;  $n_D^{20}$  1.4436. Found, %: C 64.70; 64.79; H 10.02, 9.79; MR<sub>D</sub> 48.65. Calculated for C<sub>10</sub>H<sub>18</sub>O<sub>2</sub>, %: C 64.49; H 9.74; MR<sub>D</sub> 48.91. **2, 7-Dimethyl-1, 6-dioxaspiro[4.4]nonane (XVIII)**, yield 7.5%; mp 94-96° C (67 mm);  $n_D^{20}$  1.4386. Data in the literature [9]: bp 167-169° C (760 mm);  $n_D^{20}$  1.4389. **1-(5'-Methyl-2'-tetrahydrofuryl)butan-3-one (XIX)**. Yield was 54%; bp 102-104° C (17 mm);  $d_4^{20}$  0.9899;  $n_D^{20}$  1.4605. Found, %: C 68.90, 68.72; H 9.71, 9.64; MR<sub>D</sub> 43.39. Calculated for C<sub>9</sub>H<sub>16</sub>O<sub>2</sub>, %: C 69.19; H 10.32; MR<sub>D</sub> 43.21.

From compound XI: **2, 7, 7-Trimethyl-1, 6-dioxaspiro[4.4]nonane (XX)** with a yield of 31%. bp was 72-74° C (25 mm);  $d_4^{20}$  0.9462;  $n_D^{20}$  1.4351. Found, %: C 70.37, 70.77; H 10.76, 10.86; MR<sub>D</sub> 47.24. Calculated for C<sub>10</sub>H<sub>18</sub>O<sub>2</sub>, %: C 70.55; H 10.66; MR<sub>D</sub> 47.27. **1-(5', 5'-Dimethyl-2'-tetrahydrofuryl)butan-3-one (XXI)**, yield 31.5%; bp 112-114° C (18 mm);  $d_4^{20}$  0.9710;  $n_D^{20}$  1.4559. Found, %: C 69.98, 69.92; H 10.70, 10.42; MR<sub>D</sub> 47.65. Calculated for C<sub>10</sub>H<sub>18</sub>O<sub>2</sub>, %: C 70.55; H 10.66%; MR<sub>D</sub> 47.83.

From compound XII, **2, 7-Dimethyl-7-ethyl-1, 6-dioxaspiro[4.4]nonane (XXII)**, with a yield of 67.3%; bp 92-93° C (25 mm);  $d_4^{20}$  0.9387;  $n_D^{20}$  1.4408; Found, %: C 71.88, 72.05; H 11.08, 11.12; MR<sub>D</sub> 51.82. Calculated for C<sub>11</sub>H<sub>20</sub>O<sub>2</sub>, %: C 71.69; H 10.94; MR<sub>D</sub> 51.88. **1-(5'-Methyl-5'-ethyl-2'-tetrahydrofuryl)butan-3-one (XXVII)** with a yield of 10.6%; bp 103-105° C (5 mm);  $d_4^{20}$  0.9724;  $n_D^{20}$  1.4630. Found, %: C 71.44, 70.88; H 11.01, 10.80; MR<sub>D</sub> 52.26. Calculated for C<sub>11</sub>H<sub>20</sub>O<sub>2</sub>, %: C 71.69; H 10.94; MR<sub>D</sub> 52.45.

From Compound XIII. **2-Methoxy-2, 7, 9, 9-tetramethyl-1, 6-dioxaspiro[4.4]nonane (XXIII)** with a yield of 83.3%; bp 101-103° C (15 mm);  $d_4^{20}$  0.9907;  $n_D^{20}$  1.4501. Found, %: C 66.96, 66.92; H 10.21, 9.83; MR<sub>D</sub> 58.14. Calculated for C<sub>12</sub>H<sub>22</sub>O<sub>2</sub>, %: C 67.25; H 10.35; MR<sub>D</sub> 58.15. **2, 7, 9, 9-Tetramethyl-1, 6-dioxaspiro[4.4]nonane (XXIV)**; yield was 4.5%; bp 87-89° C (25 mm);  $n_D^{20}$  1.4390; data in the literature [13]: bp 87-89° C (25 mm);  $n_D^{20}$  1.4391.

On hydrogenation of compound XVI the following compounds were obtained. **Spiro[3H-cyclopentafuran-2, 2'-(5'-methyl)tetrahydrofuran] (XXV)**, yield 41.5%; bp 103-104° C (20 mm);  $d_4^{20}$  1.019;  $n_D^{20}$  1.4680. Found, %: C 71.89, 71.96; H 9.72, 9.68 MR<sub>D</sub> 49.72. Calculated for: C<sub>11</sub>H<sub>18</sub>O<sub>2</sub>, %: C 72.51; H 9.93; MR<sub>D</sub> 49.68. **1-( $\alpha$ -Cyclopentatetrahydrofuryl)butan-3-one (XXVI)**, yield 46%; bp 98-99° C (5.5 mm);  $d_4^{20}$  1.045;  $n_D^{20}$  1.045;  $n_D^{20}$  1.4815. Found, %: C 72.08, 71.91; H 9.73 9.37; MR<sub>D</sub> 49.68. Calculated for C<sub>11</sub>H<sub>18</sub>O<sub>2</sub>, %: C 72.51; H 9.93; MR<sub>D</sub> 50.25.
