

HYDROSILYLATION OF N-ALLYLPYRROLIDINE
AND N-ALLYLPYPERIDINE *

UDC 547.245'743.1'822.3

It was found that the hydrosilylation of N-allylpyrrolidine and N-allylpiperidine by trialkylsilanes, triethoxysilane, and 3H-heptamethyltrisiloxane in the presence of $H_2PtCl_6 \cdot 6H_2O$ proceeds to form γ -adducts.

In the hydrosilylation of allylamine and its N-alkyl and N-alkylsilyl derivatives, the silyl group adds to the terminal atom of the double bond to form γ -adducts [2-6].

We have carried out the hydrosilylation of N-allylpyrrolidine (I) and N-allylpiperidine (II) with trialkylsilanes, triethoxysilane, and 3H-heptamethyltrisiloxane in the presence of a 0.1 M solution of $H_2PtCl_6 \cdot 6H_2O$ in isopropyl alcohol. Signals of the protons of the $SiCH(CH_3)CH_2N$ grouping are absent in the PMR

*Communication XXXII from the series "Nitrogen-Containing Organosilicon Compounds." See [1] for communication XXXI.

TABLE 1. Hydrosilylation of N-Allylpyrrolidine (I) and N-Allylpiperidine (II)

Starting compounds	Amounts of reagents						Yield	
	I (or II), g	hydrosilane		catalyst, ml	Order of mixing the reagents*	Heating time at 100°, h	g	%
		g	m-mole					
I, $CH_3(C_4H_9)_2SiH$	4,35	6,34	40	0,13	A	12	7,27	93
I, $(C_2H_5)_3SiH$	4,04	4,17	36	0,05	A	12	5,24	64
II, $CH_3(C_4H_7)_2SiH$	4,88	5,37	39	0,10	B	17	6,95	69,8
II, $CH_3(C_4H_9)_2SiH$	3,13	3,92	25	0,13	A	12	4,22	59,5
II, $CH_3(C_5H_{11})_2SiH$	4,51	6,95	36	0,10	B	17	8,55	76,2
II, $(C_2H_5)_3SiH$	6,00	6,00	48 †	0,05	C	0,5	9,20	80
II, $C_2H_5(C_2H_7)_2SiH$	9,20	10,68	74	0,05	A	15	14,28	72
II, $C_2H_5(C_4H_9)_2SiH$	4,26	6,03	34	0,08	B	17	3,09	26,1
II, $(C_3H_7)_3SiH$	4,26	5,54	34	0,10	B	17	4,70	48,7
II, $(C_4H_9)_3SiH$	4,26	7,05	34	0,10	B	17	4,30	38,8
II, $(C_2H_5O)_3SiH$	12,52	16,40	100	0,06	C	4	19,30	66,7
II, $CH_3(CH_3)_3SiO_2SiH$	2,07	3,65	16	0,02	C	2	2,67	48

*The letter A indicates the catalyst was added gradually to a mixture of the silane and alkene, B indicates the alkene was added dropwise to the heated (to 100°) mixture of silane and catalyst (0.05 ml), and the remaining amount of catalyst was then added gradually, while C indicates the mixture of silane and catalyst was added dropwise to the heated (to 100°) alkene. The course of the reaction was followed from the disappearance of the ν_{SiH} and $\nu_{C=C}$ absorption bands in the IR spectrum.

† The amount of II is indicated. A 10% excess (52 mmole) of the triethylsilane was used.

*Si.

spectra of all of the addition products. In addition, signals from the protons of the Si-CH₂ grouping (δ 0.53 and 0.45 ppm, respectively) are observed in the spectra of the products of the addition of triethoxysilane and 3H-heptamethyltrisiloxane to N-allylpiperidine. Consequently, these reactions also proceed with the formation of γ -adducts.

The structures of the products of the addition of the trialkylsilanes to N-allylpiperidine (II) are also confirmed by the agreement in their physical constants and IR absorption spectra and the constants and spectra of trialkyl(3-piperidinopropyl)silanes, which we previously obtained from trialkyl(3-chloropropyl)silane and piperidine [7].

The order of mixing the reagents (in equimolecular quantities) has a substantial effect on the reaction rate, which is greatest in the case of the addition of a mixture of the hydrosilane containing the catalyst to the heated alkene. The order of mixing the reagents did not affect the direction of hydrosilylation. The conditions used to carry out the reactions are presented in Table 1. The physical constants and results of analysis of the compounds obtained are presented in Table 2.

We thank V. A. Pestunovich for recording the PMR spectra.
