Keywords: benzyl chloride, N-methylmorpholine, furfurylideneacetylacetone, cyanoselenoacetamide, 1,4-dihydro-1,6-naphthyridine derivative, one-pot syntheses.

While continuing research into the processes involved in the "self assembly" of condensed molecules from several simple acyclic components we used 3-(furfurylidene)acetylacetone for the first time in the construction of the 1,6-naphthyridine system. By the one-pot cyclocondensation of the latter with cyanoselenoacetamide and benzyl chloride in the presence of a twofold molar quantity of N-methylmorpholine in absolute ethanol in an atmosphere of argon at room temperature we obtained the previously unknown polysubstituted 1,4-dihydro-1,6-naphthyridine **1**.
