Keywords: methylpiperidone, 1,6-naphthyridine, cyanoacetamide, heterocyclization.

In spite of the high biological activity of the derivatives of 1,6-naphthyridines and their partially hydrogenated analogs, there is little information on their synthesis based on derivatives of cyanoacetic acid [1, 2].

We studied for the first time the reaction of 1-methyl-3-(1-piperidinomethylene)-4-piperidone (**1**) with cyanothioacetamide (**2**) under the mild conditions of acid catalysis, leading to 1,6-naphthyridine **3**.

The structure of compound **3** was confirmed by the spectral data and chemical transformations. The alkylation of **3** by 6-chloromethyluracil (**4**) and ethyl chloroacetate (**5**) in an alkaline medium led to the formation of sulfide **6**, and in the case of ester **5** the product **7** from cyclization in the Thorpe-Ziegler reaction was isolated [3].
