

## BENZAZOLES. 3\*. SYNTHESIS AND ARYLSULFONYLATION OF 2-SUBSTITUTED BENZIMIDAZOLES

K. B. Abdireimov<sup>1</sup>, N. S. Mukhamedov<sup>1\*\*</sup>, M. Zh. Aiymbetov<sup>1</sup>,  
and Kh. M. Shakhidoyatov<sup>1</sup>

*2-Alkylbenzimidazoles have been obtained from o-nitroaniline and aliphatic carboxylic acids by reductive cyclization. Interaction of the former with arenesulfonyl chlorides led to the synthesis of 2-alkyl-1-arylsulfonylbenzimidazoles, the yield of which depended on the structure of the substituent in position 2.*

**Keywords:** 2-alkyl-1-arylsulfonylbenzimidazoles, 2-alkylbenzimidazoles, arylsulfonylation, reductive cyclization.

The high biological activity and broad spectrum of action of benzimidazole derivatives [2-8] has caused increased interest in them. Among 2-substituted benzimidazoles are found substances possessing antitumor, hypotensive, spasmolytic, neuroleptic, and antibacterial action [2-6], and also herbicidal, fungicidal, and growth stimulating activity [7, 8].

Communications have appeared recently on the synthesis of 2-cycloalkyl(aralkyl)benzimidazoles and sulfonylation of the latter with methane- and benzenesulfonyl chlorides [9]. Similar reactions for 2-alkylbenzimidazoles have not been studied. Continuing our investigations on the synthesis and conversion of benzazoles [1], in this work we have synthesized 2-alkylbenzimidazoles **2a-e** and have studied their interaction with arene sulfonyl chlorides.

2-Alkylbenzimidazoles were obtained previously from *o*-phenylenediamine and the appropriate acids [10].

Compounds **2a-e** were synthesized by us from *o*-nitroaniline (**1**) and aliphatic acids by reductive cyclization using iron powder and hydrochloric acid. The interaction of products **2a-e** with arene sulfonyl chlorides in the presence of triethylamine at room temperature led to 2-alkyl-1-arylsulfonyl benzimidazoles **3a-e** and **8a-e** (Table 1).

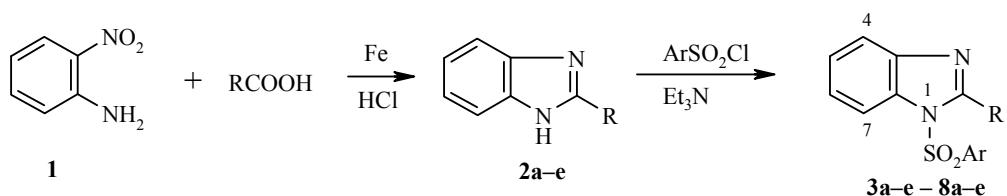

It should be noted that with the lengthening of the substituent R the yields of compounds **3a-e** and **8a-e** were reduced. This is probably explained by the action of steric factors. Substitution in Ar did not have a significant influence on the course of the reaction.

\* Solvents for recrystallization: ethanol (compounds **3a-e**, **4a-e**, **5a,b,d,e**, **6e**, **7a,c-e**, **8a-e**), aqueous ethanol (compound **5c**), benzene (compounds **6a-d**), petroleum ether (compound **7b**).

The composition and structure of the synthesized compounds **3a-e** and **8a-e** were confirmed by the results of elemental analysis, data of IR, mass, and <sup>1</sup>H NMR spectra.

There were characteristic absorption bands in the IR spectra of compounds **3-8** for the asymmetric and symmetric stretching vibrations of the SO<sub>2</sub> group in the 1100-1400 cm<sup>-1</sup> region (Table 2).

Peaks were observed in the mass spectra of compounds **3a-e** to **8a-e** for molecular ions and fragments confirming completely the structures proposed. The direction of fragmentation of the molecular ions of compounds **3a-e** to **8a-e** depended on the nature of the substituent R and did not depend on the character of the substitution in Ar. The mass spectra of compounds **3a-c** to **8a-c** showed a single type of fragmentation with cleavage of the ArSO<sub>2</sub>-Het bond, leading to [M-ArSO<sub>2</sub>]<sup>+</sup> and [M-Het]<sup>+</sup> fragments with the former possessing maximal intensity. In the mass spectra of compounds **3d,e** to **8d,e** (R = Pr, Bu) cleavage of the substituent R occurs first and then ArSO<sub>2</sub>.

The <sup>1</sup>H NMR spectra of compounds **3a-e** to **8a-e** (Table 2) contain the following signals characteristic of the benzimidazole fragment: signals of the H-4 and H-7 protons as two doublets (in the 7.55-8.01 ppm region), multiplet signals of the H-5 and H-6 protons (at 7.22-8.81 ppm), and a low field singlet for the H-2 proton (8.30-8.61 ppm). There were also signals in the spectra for the H<sub>Ar</sub> protons (6.85-7.45), and for H<sub>R</sub> protons, and for alkyl substituents in Ar (0.78-3.74 ppm).

\*<sup>1</sup>H NMR spectra were taken in CD<sub>3</sub>OD (compounds **5a-e**, **7a-e**, **8a-e**) or CDCl<sub>3</sub> (compounds **3a-e**, **4a-e**, **6a-e**).

## EXPERIMENTAL

The IR spectra of nujol suspensions of compounds were taken on a Perkin-Elmer 2000 Fourier spectrometer, and the  $^1\text{H}$  NMR spectra on a Unity 400 $^+$  (400 MHz) spectrometer, internal standard was TMS. The mass spectra were recorded on a Kratos MS-30 instrument with direct insertion of sample into the ion source (ionization energy 70 eV). A check on the progress of reactions and the homogeneity of the synthesized compounds was effected by TLC on Silufol UV-254 plates in the solvent system benzene–acetone, 10:1, the developer was a solution of  $\text{KMnO}_4$  (1 g) in  $\text{H}_2\text{SO}_4$  (4 ml) and  $\text{H}_2\text{O}$  (96 ml).

**2-Alkylbenzimidazoles 2a-e (General Method).** A mixture of compound **1** (1.38 g, 10 mmol), the appropriate carboxylic acid (60 mmol), iron powder (1.68 g, 30 mmol) and 32% HCl (10 ml) was heated to 70°C. After the end of the vigorous evolution of hydrogen the mixture was maintained at the same temperature for 1 h, and then at 90–100°C for 2 h. The reaction mixture was cooled, 20% NaOH solution was added to pH 9–10, the precipitated solid was filtered off, and washed with water until neutral reaction. Alcohol (20 ml) was added to the washed solid, the mixture was boiled for 1 h, and filtered without cooling. Alcohol (~10 ml) was distilled from the filtrate, the residue was diluted with three volumes of water, the resulting product **2** was filtered off, and recrystallized from the appropriate solvent. The melting points of the synthesized compounds **2a-e**, and of samples of them obtained by cyclization of *o*-phenylenediamine with carboxylic acids [10], coincided.

**2-Alkyl-1-arylsulfonylbenzimidazoles 3a-e to 8a-e (General Method).** A solution of compound **2** (10 mmol) and triethylamine (1.11 g, 11 mmol) in acetone (30 ml) was added dropwise to a solution of the appropriate arene sulfonyl chloride (11 mmol) in acetone (20 ml). The reaction mixture was stirred at room temperature for 4 h, the acetone was then distilled, and water (50 ml) was added to the residue. The solid product obtained of **3a-e** to **8a-e** was filtered off and recrystallized from the appropriate solvent.
