Comment on “Transformation of 4-Connected Zeolite Topologies into a Mixed 4- and 6-Connected 3-Dimensional Open Framework”

In *Chem. Mater.* **1999**, *11*, 3025–3027, a germanate open framework was published as UCSB-46. Its framework was later to be identified as the same as the one reported as ICMM-2 in *Angew. Chem., Int. Ed.* **1999**, *38*, 2436–2439. This coincidence was subsequently pointed out in *Chem. Mater.* **2000**, *12*, 1505–1507. Since ICMM-2 was prepared from metal complexes while UCSB-46 was prepared from methylamine, it shows that the same germanate framework can be obtained by using different directing agents.
