UDC 547.918:543.422

The genus Sideritis is represented in Turkey by 46 species and altogether 53 taxa of these being endemic in Turkey (74%) [1-3].

Sideritis species are widely used as herbal tea in Turkey. They are known by different local names and traditionally used in various regions of Turkey. Infusions of *Sideritis* species are used as stomachics, antispasmodics, carminatives, and taken for cough [4-9]. The aqueous extracts of five *Sideritis* species of Turkey have been found to have antidepressant and antistress activities in mice [10]. The essential oil of *S. congesta* exhibited no significant analgesic action [11].

Here, we report on the essential oil compositions of *Sideritis brevidens* P.H. Davis and *S. rubriflora* Hub.-Mor., which are endemic species of Turkey. *S. brevidens* is locally known as "Adacayı" and "Ozel Cay," while *S. rubriflora* Hub.-Mor. is locally known as "Dag cayı" in Icel. Both *Sideritis* species are used as herbal tea in the areas where they grow.

In the present work, the essential oils of these *Sideritis* species were investigated for the first time.

Essential oils were obtained from dried aerial parts by water distillation. Results of GC/MS analyses of the essential oils are given in Tables 1 and 2. In the oil of *S. brevidens* and *S. rubriflora* 75 and 98 compounds were characterized representing 91 and 87% of the oils with β-pinene (14 and 13%) and epicubebol (13 and 8%) as major constituents, respectively.

Essential oils of Turkish *Sideritis* species are classified into six groups, namely, "monoterpene hydrocarbon-rich," "oxygenated monoterpene-rich," "sesquiterpene hydrocarbon-rich," "oxygenated sesquiterpene-rich," "diterpene-rich," and "others." Of the *Sideritis* species existing in Turkey, 57% belong to the "monoterpene hydrocarbon-rich" group. *S. brevidens* and *S. rubriflora* were also included in this group.

EXPERIMENTAL

Plant Materials. *S. brevidens* was collected in July 1994 at Icel: Gulnar, step, ESSE 10713, *S. rubriflora* was collected in May 1994 at Icel: Anamur-Aydincik, step, ESSE 10654. Voucher specimens are kept at the Herbarium of the Andolu University Faculty of Pharmacy in Eskishehir, Turkey (ESSE).

Distillation. Plant materials were hydrodistilled for 3 h using a Clevenger-type apparatus. The percentage yields of the oils calculated on a moisture free basis were as follows: *S. brevidens* 0.7% and *S. rubriflora* 0.18%.

GC/MS. The essential oils were analyzed by GC/MS system. GC/MS analysis was carried out using a Hewlett-Packard GCMSD system. Innowax FSC column (60 m × 0.25 mmø with 0.25 µm film thickness) was used with helium as a carrier gas. GC oven temperature was kept at 60°C for 10 min and programmed to 220°C at a rate 4°C/min, then kept constant at 220°C for 10 min and then 240°C at a rate of 1°C/min. The split ratio was adjusted at 50:1.

KI = Kovats index on Innowax.

The injector and detector temperatures were at 250°C. MS were taken at 70eV. Mass range was from *m/z* 35 to 425. Library search was carried out using the Wiley GC/MS Library and the TBAM Library of Essential Oil Constituents. Relative percentage amounts of the separated compounds were calculated from total Ion Chromatogrammes by the computerized integrator.
