

## ESSENTIAL OIL COMPOSITION OF TWO ENDEMIC SPECIES OF *Stachys* L. FROM IRAN

K. Javidnia,<sup>1,2\*</sup> R. Miri,<sup>1,2</sup> M. Soltani,<sup>1</sup> and A. R. Khosravi<sup>3</sup>

UDC 547.913

The yields of the oils of *Stachys acerosa* and *S. aucheri* were 0.01 and 0.02% respectively. Data obtained from qualitative and quantitative determination of the oil sample is shown in Table 1. Fifty-three components representing 95.5% of the total oil of *S. acerosa* and fifty-six compounds of *S. aucheri* equivalent to 95.6% were identified. The major constituents of the oil of *S. acerosa* were caryophyllene oxide (27.5%),  $\alpha$ -pinene (16.4%), intermedol (7.6%), and 7-*epi*- $\alpha$ -selinene (7.0%). For *S. aucheri* these compounds were viridiflorol (40.9%), spathulenol (19.7%), and *cis*-chrysanthenyl acetate (19.7%).

Spathulenol was one of the main components of the oil of *S. pilfera* and *S. obtuscirena*, and *cis*-chrysanthenyl acetate was one of the other main components of the oil of *S. pilfera* [1, 2].

In a previous work on *S. acerosa* [3], the major compounds stated were *cis*-chrysanthenyl acetate (41.0%) and linalool (23.5%), which was completely different from this study. *cis*-Chrysanthenyl acetate, the first major compound of *S. acerosa* in previous work, was the second major compound of *S. aucheri*. These two species are in the same subgenus (*Aucherianan*) of the genus *Stachys*. Germacrene D, which is the major compound of several *Stachys* species, was not found in our oils [4–9]. Viridiflorol, the first major compound of *S. aucheri*, is the fourth one in the oil of *S. lanata* (10.5%) [10]. The essential oil composition of *S. aucheri* is reported here for the first time.

TABLE 1. The Chemical Constituents of the Essential Oils of *Stachys acerosa* and *S. aucheri*, %

Compound	RI	<i>S. acerosa</i>	<i>S. aucheri</i>	Compound	RI	<i>S. acerosa</i>	<i>S. aucheri</i>
