Fraxinus raibocarpa Rgl. (Oleaceae) is widely distributed in the flora of Central Asia [1]. The aerial part is used in folk medicine as a relaxant [2] and for cardiovascular diseases [3].

Carbohydrates and the flavonoids kaempferol, astragalin, isoquercitrin, and rutin, were isolated earlier from this plant [4].

We studied the aerial part of *F. raibocarpa* collected during flowering in Tashkent Oblast, Republic of Uzbekistan. Air-dried plant (740 g) was extracted with EtOH (70%). The extract was condensed and diluted with H₂O (1:1). The diluted solution was worked up successively with hydrocarbons, CHCl₃, EtOAc, and BuOH. Evaporation of the solvents afforded CHCl₃ (8 g), EtOAc (15 g), and BuOH (15 g) fractions.

TLC studies of the resulting fractions found that the CHCl₃ fraction contained mainly coumarins; EtOAc and BuOH, terpenoids and phenolic compounds.

Column chromatography of the BuOH fraction over silica gel using CHCl₃:MeOH (15:1, 9:1, 4:1) isolated five compounds: C₈H₁₀O₂ (**1**), mp 94–95°C; C₁₇H₂₄O₁₀ (**2**), mp 195°C; C₁₄H₂₀O₇ (**3**), mp 165°C; C₆H₁₄O₆ (**4**), mp 166°C; C₂₇H₃₀O₁₆ (**5**), mp 189–191°C.
