# The Reactions of 3, 7-Dinitrodibenzobromolium Salt with Some Amines 

Zi Jie HOU, Xian Hua PAN, Ling HE<br>Institute of Organic Chemistry and National Laboratory of Applied Organic Chemistry, Lanzhou University, Lanzhou 730000

#### Abstract

The reactions of 3,7-dinitrodibenzobromolium salt with some amines were studied. A reaction mechanism based on the structure of the major product 6 and the minor product 7 was proposed. The reaction was considered to proceed via a substituted benzyene intermediate.

Keywords: 3, 7-Dinitrodibenzobromolium salt, amine, benzyene, reaction mechanism.

We have reported the reaction of 3, 7-dinitrodibenzobromolium salt with various nucleophiles and the formation of the major product 2 was explained to be via the nucleophilic attack of the carbon next to the bromide followed by the leaving of the $\mathrm{Br}^{+}$ group (Scheme 1) ${ }^{1,2}$. Later, it was found out that the major product of the reaction between 1 and some sulfoxides in the presence of equal molar of basic nucleophile was 2-sulfoniophenolate 3. Therefore, a mechanism of the formation of $\mathbf{3}$ was proposed to be through substituted benzyene $\mathbf{4}$ as an intermediate (Scheme 2) ${ }^{3}$. Since compound 5 which is the regio isomer of $\mathbf{3}$ was not isolated, we could not confirm the above mechanism.

## Scheme 1

Scheme 2

[^0]In order to get enough proof for this mechanism, the following reactions were designed and performed. The reason, compound $\mathbf{1}$ did not give the intermediate $\mathbf{4}$, is that the excess amount of the amine was reacted with the intermediate 4 to give the regio isomers 6 and 7 (Scheme 3).

The reactions of $\mathbf{1}$ with a series of primary and secondary amines were studied. We found that for each reaction, $\mathbf{6}$ was the major product, $\mathbf{7}$ was a minor product. The Rf value of both compounds was very close. The spectrum data showed that compound 7 was the regio isomer of compound $\mathbf{6}$. The yields of the products were listed in Table 1. Since the differences of the chemical shifts of the aromatic protons of $\mathbf{6}$ and 7 were obvious, the structures can be easily deduced by simple analysis of the aromatic substitution effect and the relating coupling constants. The electron-withdrawn effect of the nitro group gave rise to the difference of the yield between $\mathbf{6}$ and $\mathbf{7}^{4}$. Obviously, these results strongly supported the mechanism that the reaction was proceeded through the intermidiate 4.

Scheme 3

Table 1 The yields of 6 and 7

| Amine | Major product (yield*\%) | Minor product (yield* \%) |
| :--- | :---: | :---: |
| n-BuNH $_{2}$ | $\mathbf{6 a}(41)$ | $\mathbf{7 a}(19)$ |
| c-HexNH | (4b | (13) |
| Piperidine | $\mathbf{6 b}(50)$ | $\mathbf{7 c}(14)$ |
| $\mathrm{PhNH}_{2}$ | $\mathbf{6 c}(43)$ | $\mathbf{7 d}(26)$ |
| $\mathrm{BnNH}_{2}$ | $\mathbf{6 d}(54)$ | $\mathbf{7 e}(15)$ |
| *Isolated yield | $\mathbf{6 e}(40)$ |  |

## Experimental

IR were recorded using Nicolet 170-SX spectrometer. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on an Avance DRX 200 instrument $\left(\mathrm{CDCl}_{3}\right.$ was used as the solvent with TMS as an internal chemical shift reference). MS measurements were performed on HP 5890 spectrometer. Melting points were determined on Kofler hot-stage apparatus. The thermometer was uncorrected. Compound 1 was prepared according to ref. 5.

## General procedure

A mixture of compound $1(0.5 \mathrm{mmol})$, amine ( 10 mmol ) was stirred at r.t. for 6 h . The reaction mixture was poured into cold water $(30 \mathrm{~mL})$, filtered and washed with water to give a brown filter cake. The filtrate was extracted with ethyl acetate ( $5 \mathrm{~mL} \times 3$ ). The filter cake was dissolved in the organic layer of the extraction and filtered. The filtrate was dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The residue was purified by silica
gel chromatography with petroleum/ethyl acetate (5/1) as an elute to give $\mathbf{6}$ and 7 (yields of $\mathbf{6}$ and 7 were listed in Table 1), respectively. 6a: orange crystals, $\mathrm{mp} 106-107^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR: $0.93\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 1.20-1.70\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2}-\right), 3.19(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=7.2 \mathrm{~Hz}$, $\left.\mathrm{NHCH}_{2}-\right), 7.12\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{ab}}=8.3 \mathrm{~Hz}, \mathrm{H}_{\mathrm{a}}\right), 7.51\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{de}}=8.4 \mathrm{~Hz}, \mathrm{H}_{\mathrm{d}}\right), 7.58\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{bc}}=\right.$ $\left.2.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{c}}\right), 7.63\left(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{ab}}=8.3 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{bc}}=2.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{b}}\right), 8.31\left(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{de}}=8.4 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{ef}}=2.2\right.$ $\left.\mathrm{Hz}, \mathrm{H}_{\mathrm{e}}\right), 8.62\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{ef}}=2.2 \mathrm{~Hz}, \mathrm{H}_{\mathrm{f}}\right) . \quad \mathrm{MS}(\mathrm{m} / \mathrm{z}): 395,393\left(\mathrm{M}^{+}, 32,33\right), 352,350$ $\left(\left[\mathrm{M}-\mathrm{C}_{3} \mathrm{H}_{7}\right]^{+}, 61,65\right), 271\left(\left[\mathrm{M}-\mathrm{Br}^{\left.-\mathrm{C}_{3} \mathrm{H}_{7}\right]^{+} \text {, (70), } 270 \text { (100). 6b: orange crystals, mp }}\right.\right.$ $150-151{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR: $1.06-2.18\left(\mathrm{~m}, 10 \mathrm{H},-\left(\mathrm{CH}_{2}\right)_{5}-\right), 3.28-3.60(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NHCH}), 7.08(\mathrm{~d}$, $\left.1 \mathrm{H}, \mathrm{J}_{\mathrm{ab}}=8.4 \mathrm{~Hz}, \mathrm{H}_{\mathrm{a}}\right), 7.51\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{de}}=8.4 \mathrm{~Hz}, \mathrm{H}_{\mathrm{d}}\right), 7,56\left(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{bc}}=2.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{c}}\right), 7.59(\mathrm{dd}$, $\left.1 \mathrm{H}, \mathrm{J}_{\mathrm{ab}}=8.4 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{bc}}=2.0 \mathrm{~Hz}, \mathrm{H}_{\mathrm{d}}\right), 8.31\left(\mathrm{dd}, 1 \mathrm{H}, \mathrm{J}_{\mathrm{de}}=8.4 \mathrm{~Hz}, \mathrm{~J}_{\mathrm{ef}}=2.4 \mathrm{~Hz}, \mathrm{H}_{\mathrm{e}}\right), 8.60(\mathrm{~d}, 1 \mathrm{H}$, $\left.\mathrm{J}_{\mathrm{ef}}=2.4 \mathrm{~Hz}, \mathrm{H}_{\mathrm{f}}\right) . \mathrm{MS}(\mathrm{m} / \mathrm{z}): 421,419\left(\mathrm{M}^{+}, 53,53\right), 378,376\left(\left[\mathrm{M}-\mathrm{C}_{3} \mathrm{H}_{7}\right]^{+}, 96,100\right)$.
