

Table 1 Acidic inorganic salts promoted Ullmann coupling of bromobenzene (**1a**)^a

Entry	Additive	Isolated yield/%
1	—	21
2	NH ₄ Cl	32
3 ^b	NH ₄ Cl	67
4 ^c	NH ₄ Cl	38
5 ^d	NH ₄ Cl	<5
6	(NH ₄) ₂ SO ₄	35
7	Al ₂ (SO ₄) ₃	23
8	CeCl ₃	54
9	Ce ₂ (SO ₄) ₃	38
10	Na ₂ HPO ₄	34
11	NaH ₂ PO ₄	19

^a Reaction conditions: bromobenzene (**1a**) (2 mmol), Pd/C (5% w/w, 300 mg, 7 mol%), zinc (170 mg, 2.6 mmol), additive (2 mmol), and H₂O (5 mL) at room temperature for 24 h. ^b NH₄Cl (1 mmol). ^c NH₄Cl (4 mmol). ^d Aqueous NH₄Cl saturated solution (5 mL) as the reaction solvent.

ent substituents were carried out smoothly in the presence of NH₄Cl, Pd/C, and zinc. The results also indicated that the reaction rate depended upon the structure of the bromides involving both the properties and position of the substituents on the aromatic ring. The rate of the coupling was in the order of **1b**—**1c** (24 h) > **1e**, **1g** (48 h) > **1f** (72 h). The results also demonstrated that the coupling reaction was inefficient in the absence of NH₄Cl (Entries 1 and 2). For example, only 17% of **2b** was obtained without NH₄Cl, whereas the yield of **2b** was increased to 65% in the presence of 1 equiv. of NH₄Cl.

Li^{2a,2b} and Sasson^{2d} proposed two reaction mechanisms respectively. One was a direct metal-to-metal electron transfer process, the other was the reduction of palladium intermediate *in situ* by hydrogen gas. We noticed that Li's reaction conditions were neutral and Sasson's were basic, but the present reaction conditions were acidic. So the present reaction might proceed via the latter mechanism. A possible mechanism for the NH₄Cl-promoted palladium-catalyzed coupling reaction was proposed as outlined in Scheme 2. It is well-known that NH₄Cl in water readily lowered the pH value of the reaction system, so the first step might be the reaction of NH₄Cl with H₂O yielding H⁺, which then afforded H₂ by reacting with Zn. In the presence of H₂, Pd(0) might react with either aryl bromide or H₂ to give intermediate **3** (ArPdBr) and intermediate **5** (Pd²⁺(H⁻)₂), respectively. Intermediate **3** reacted with another ArBr to afford in-

Table 2 Palladium-catalyzed Ullmann coupling of aryl bromides^a

Entry	Aryl halide	Time/h	Yield ^b /%
1		1b	24 65 (2b)
2 ^c		1b	48 17 (2b)
3		1c	24 47 (2c)
4		1d	24 57 (2d)
5		1e	48 55 (2e)
6		1f	72 48 (2f)
7 ^d		1g	48 61 (2g)

^a Reaction conditions: **1** (2 mmol), Pd/C (5% w/w, 300 mg, 7 mol%), Zn (170 mg, 2.6 mmol), NH₄Cl (2 mmol), and H₂O (5 mL) at room temperature. No aromatic halides were detected by GC analysis after the desired reaction time. ^b Isolated yield. ^c No NH₄Cl added. ^d 2-Naphthol, a reduction product, was obtained in 37% yield.

Scheme 2 Mechanism of the palladium-catalyzed Ullmann type coupling reaction

intermediate **4** and PdBr₂. Intermediate **4** then underwent reductive elimination to release **2** and regenerate the active Pd(0) species. PdBr₂ could also react with H₂ to regenerate the active Pd(0) species. In the meantime,

aryl bromide could be reduced by intermediate **5** to give ArH.

In Sasson's work,^{2d} NaOH was added to reduce the concentration of intermediate **5** resulting in high selectivity toward the coupling. So we believed that the function of NH₄Cl is similar to that of NaOH, which could decrease the concentration of intermediate **5** to affect the selectivity of the coupling due to the acidity of NH₄Cl [Eq. (1)].

In conclusion, we have developed a mild and cheap method for homo-coupling of various aromatic bromides to synthesize diphenyl and its derivatives. The results showed that NH₄Cl dramatically influenced the selectivity of the palladium-catalyzed coupling reaction. Further study of the mechanism and application of the method are in progress.

Experimental

All ¹H and ¹³C NMR spectra were recorded on a DRX-400 or 300 spectrometer with CDCl₃ as solvent. All reagents were used directly as obtained commercially. All products **2a**—**2g** are known and their detailed spectral data are as identical with those previously described.¹⁻⁶ All melting points are uncorrected.⁷⁻¹¹

General procedure for NH₄Cl promoted palladium-catalyzed Ullmann-type coupling

A mixture of aryl bromide **1** (2 mmol), Pd/C (5% w/w, 300 mg, 7 mol%), Zn (170 mg, 2.6 mmol), NH₄Cl (2 mmol) and H₂O (5 mL) was stirred at room temperature for the desired time. Then the mixture was extracted (ether), dried (anhydrous Na₂SO₄) and concentrated by rotoevaporation to give the crude product. Pure product **2** was obtained by flash column chromatography (hexane/ethyl acetate).

Biphenyl (2a): White solid, m.p. 68—71 °C (uncorrected) (lit.⁷ m.p. 69—70 °C). ¹H NMR (CDCl₃, 400 MHz) δ: 7.59 (d, *J*=8.4 Hz, 4H), 7.44 (t, *J*=8.0 Hz, 4H), 7.39 (t, *J*=7.6 Hz, 2H); ¹³C NMR (CDCl₃, 100 MHz) δ: 141.2, 129.9, 128.7, 127.2; MS (70 eV) *m/z* (%): 154 (M⁺, 100), 76 (40).

4,4'-Dimethyl-biphenyl (2b): White solid, m.p. 117—121 °C (uncorrected) (lit.⁸ m.p. 122—123 °C). ¹H NMR (CDCl₃, 400 MHz) δ: 7.46 (d, *J*=8.0 Hz, 4H), 7.22 (d, *J*=7.6 Hz, 4H), 2.37 (s, 6H); ¹³C NMR (CDCl₃, 100 MHz) δ: 138.3, 136.7, 129.4, 126.8, 21.0; MS (70 eV) *m/z* (%): 182 (M⁺, 100), 164 (75), 77 (17).

2,2'-Dimethyl-biphenyl (2c):¹⁻⁶ Colorless oil. ¹H NMR (CDCl₃, 400 MHz) δ: 7.25—7.20 (m, 6H), 7.09 (d, *J*=7.6 Hz, 2H), 2.04 (s, 6H); ¹³C NMR (CDCl₃, 100 MHz) δ: 141.6, 135.8, 129.8, 129.3, 127.1, 125.5, 19.8; MS (70 eV) *m/z* (%): 182 (M⁺, 100), 164 (53), 92 (100), 75 (13).

4,4'-Dimethoxy-biphenyl (2d): White solid, m.p.

175—179 °C (uncorrected) (lit.⁸ m.p. 176—177 °C). ¹H NMR (CDCl₃, 400 MHz) δ: 7.46 (d, *J*=8.8 Hz, 4H), 7.22 (d, *J*=8.8 Hz, 4H), 3.82 (s, 6H); ¹³C NMR (CDCl₃, 100 MHz) δ: 138.3, 136.7, 129.4, 126.8, 55.3; MS (70 eV) *m/z* (%): 214 (M⁺, 100), 200 (31), 183 (100), 76 (11).

4,4'-Bis(dimethylamino)biphenyl (2e): White solid, m.p. 192—195 °C (uncorrected) (lit.⁹ m.p. 193—194 °C). ¹H NMR (CDCl₃, 300 MHz) δ: 7.05 (d, *J*=8.0 Hz, 4H), 6.63 (d, *J*=8.0 Hz, 4H), 2.94 (s, 12H); ¹³C NMR (CDCl₃, 75 MHz) δ: 129.7, 113.4, 41.3, 40.2; MS (70 eV) *m/z* (%): 240 (M⁺, 100), 226 (23), 196 (45), 77 (8).

2,6,2',6'-Tetramethoxy-biphenyl (2f): White solid, m.p. 173—174 °C (uncorrected) (lit.¹⁰ m.p. 174—175 °C). ¹H NMR (CDCl₃, 300 MHz) δ: 6.93—6.83 (m, 6H), 3.79 (s, 6H), 3.72 (s, 6H); ¹³C NMR (CDCl₃, 75 MHz) δ: 153.7, 151.7, 129.0, 117.5, 113.8, 112.9, 56.9, 56.1; MS (70 eV) *m/z* (%): 274 (M⁺, 100), 244 (51), 74 (7).

[1,1']-Binaphthalenyl-2,2'-diol (2g): White solid, m.p. 213—217 °C (uncorrected) (lit.¹¹ m.p. 215 °C). ¹H NMR (CDCl₃, 300 MHz) δ: 7.98 (d, *J*=9.0 Hz, 2H), 7.89 (d, *J*=8.7 Hz, 2H), 7.40—7.26 (m, 6H), 7.15 (d, *J*=6.6 Hz, 2H), 1.54 (s, 2H); ¹³C NMR (CDCl₃, 75 MHz) δ: 153.1, 133.7, 131.8, 129.8, 128.8, 124.5, 124.4, 118.1, 111.2; MS (70 eV) *m/z* (%): 286 (M⁺, 100), 268 (83), 142 (25).
