8-ALKYL AND 8-CYCLOALKYL-10-PIPERAZINODIBENZO[b,f]THIEPINS*

V.VALENTA, J.METYŠOVÁ, Z.ŠEDIVÝ and M.PROTIVA Research Institute of Pharmacy and Biochemistry, 130 00 Prague 3

Received June 1st, 1973

Proceeding from 4-ethyl, 4-isopropyl, 4-n-butyl, 4-n-octyl, 4-cyclopropyl and 4-cyclopentyl thiophenols, the corresponding 8-substituted dibenzo [b, f] thiepin-10(11H)-ones XIV were synthesized via the intermediates IX-XIII. The ketones XIV were further converted to the 10-piperazino derivatives of the 10,11-dihydro series I-VI and further to enamines VII. Starting from the cyclopropyl acid IXe, the cyclopropyl analogue (XXVII) of the neuroleptic chlorprothixene was synthesized in three steps. The piperazine derivatives Ia, Ib, Ie, IIa, IIb and VIIb were found to be very effective neuroleptics with a high degree of central depressant and cataleptic activity.

In the present pharmacochemical research of 8-substitution derivatives of 10-(4--methylpiperazino)-10,11-dihydrodibenzo [b, f] thiepin which are generally neuroleptically active, relatively little attention has been devoted so far to alkyls as 8-substituents. The synthesis of the 8-methyl derivative $(I, R^1 = CH_3)$ and of the 8-tert-butyl derivative $(I, \mathbb{R}^1 = C(CH_3))$ (ref.¹) has been described, the first of these having been found to be a four-fold more potent central depressant than chlorpromazine, the second of these being slightly weaker than chlorpromazine. At the same time, in the phenothiazine series of neuroleptics with a similarly localized substituent of alkyl type, only the ethyl derivative² "ethylisobutrazine" found practical application while in the thioxanthene series of 2-alkyl derivatives of prothixene the isopropyl derivative was found to be most effective here³. For this reason we thought it useful to extend the information on the 8-alkyl derivatives of this series and we started to work with the 8-ethyl, 8-isopropyl, 8-n-butyl and 8-n-octyl derivatives Ia-Id. The study included two representatives of the series of 8-cycloalkyl derivatives, viz. the 8-cyclopropyl derivative Ie and the 8-cyclopentyl derivative If. In a number of cases, the principal N-methyl derivatives I were supplemented with further N-substitution analogues II - VI and further with the 10-unsaturated analogues, the enamines VII.

During synthesis of I - VII we generally adhered to the usual scheme¹, using the corresponding 4-substituted thiophenols as the starting compounds. The thiophenols were condensed in the first step with 2-iodobenzoic acid⁴ in the presence of potassium

^{*} ____ Part LXX in the series Neurotropic and Psychotropic Agents; Part LXIX: This Journal 39, 617 (1974).

hydroxide to the corresponding 2-(4-subst. phenylthio)benzoic acids IX (method A). The second step consisted in the reduction of these acids with sodium bis(2-metho-

In all formulae: $a, R^* = CH_2CH_3; b, R^* = CH(CH_3)_2; c, R^* = (CH_2)_3CH_3; d, R^1 = (CH_2)_7CH_3; e, R^1 = - ; f, R^1 = -]$

xvethoxy)dihydroaluminate⁵ to the 2-(4-subst, phenylthio)benzyl alcohols X (method B). In a further step, these alcohols were converted by treatment with thionyl chloride (method C) to the 2-(4-subst.phenylthio)benzyl chlorides XI which were refluxed with aqueous-ethanolic potassium evanide (method D) giving the nitriles XII. Alkaline hydrolysis of these nitriles (method E) then yielded the 2-(4-subst.phenylthio) phenylacetic acids (XIII). Cyclization to the 8-subst.dibenzo b, f thiepin--10(11H)-ones (XIV) was usually carried out by heating with polyphosphoric acid (method F). Ketones were reduced with sodium borohydride in aqueous ethanol (method G) to alcohols XV which were treated with hydrogen chloride in benzene (method H) to yield the chlorides XVI. Substitution reactions of these chlorides with 1-methylpiperazine, 1-(3-hydroxypropyl)piperazine⁶, or with 1-ethoxycarbonylpiperazine⁷ (method J) resulted in the piperazine derivatives I - III. The substitution reactions were accompanied by elimination reactions giving rise to 2-substituted dibenzo [b, f] this pins (VIII) which were in most cases isolated and characterized. Alkaline hydrolysis of carbamates III (method K) yielded secondary amines IV. With a view to the possibility of obtaining a protracted effect by esterification of alcohols of type II with fatty acids containing a longer chain⁸, reaction of alcohols II with capryloyl⁹ and lauroyl chlorides¹⁰ in benzene (method L) was used for the preparation of esters V and VI. Reactions of ketones XIV with 1-methylpiperazine and titanium tetrachloride in benzene (method M) led to enamines VII (ref.¹¹⁻¹³). The experimental section shows only examples of preparations using the above general methods. All the compounds prepared are included together with the usual experimental data in Table I.

8-Alkyl- and 8-Cycloalkyl-10-piperazinodibenzo[b,f]thiepins

In the ethyl series (a) we proceeded from the described 2-(4-ethylphenylthio)benzoic acid³ (IXa) and used the above general reactions. Only in the case of cyclization of XIIIa with polyphosphoric acid to the ketone XIVa a modified method was used, consisting in the presence of toluene as solvent for the organic reaction components (method F-1). In the isopropyl series (b) the starting compound was 4-isopropylthiophenol¹ which had been obtained by reduction of 4-isopropylbenzenesulfonyl chloride¹ with phosphorus and iodine in boiling acetic acid (method¹⁴). This was then³ transformed to acid IXb. The ketone XIVb was obtained in approximately the same yield with method F at 150°C as with method F-1. Likewise, in the n-butyl series (c) the starting 4-n-butylthiophenol¹ was obtained by reduction of 4-(n-butyl)benzenesulfonyl chloride¹ with lithium aluminium hydride in ether. 2-(4-n-Butylphenylthio)benzoic acid (IXc) has been reported previously³. Ketone XIVc has been obtained by the F-1 method. The other compounds of this series were prepared by application of general methods.

Synthesis of the n-octyl derivative Id was motivated differently from the preparation of other compounds of this series. Preliminary tests of the ethyl derivative Ia and of the n-butyl derivative Ic showed that with extension of the alkyl chain in position 8 the central activity decreased. On the other hand, the antimicrobial activity rose (Table III), this raising the interest in compounds with a longer alkyl in the given position. In the n-octyl series (d) the preparation of the starting 4-n-octylthiophenol has been described in the literature¹⁵ but here we used also the novel procedure, *viz.* reduction of 4-(n-octyl)benzenesulfonyl chloride¹⁶ with phosphorus and iodine in acetic acid. The work in this series was rather complicated by the highly lipophilic character of all the intermediates which decreased the yields and complicated the isolation. For reducing the acid IXId to the alcohol Xd we used lithium aluminium hydride in ether¹. Cyclization of acid XIIId was carried out by method F at 160 to 170°C; the ketone XIVd was characterized as crystalline 2,4-dinitrophenylhydrazone.

The attempt at preparing the analogous n-dodecyl derivative was motivated similarly to the work in the n-octyl series but the work was not completed because of the extremely lipophilic character of the intermediates. n-Dodecylbenzene¹⁷ was chlorosulfonated and the crude 4-(n-dodecyl) benzenesulfonyl chloride was reduced with phosphorus and iodine in acetic acid to the novel 4-n-dodecylthiophenol (XVII) which was converted in a poor yield by method A to the acid XVIII.

Investigation in the cyclopropyl series (e) was attractive because of the similarity of cyclopropyl with isopropyl (the favourable effect of which on activity was confirmed in this series) as well as because of lack of reports on this substituent's effect on the aromatic ring on the neuroleptic activity in other series; the 2-cyclopropyl derivatives of the phenothiazine series, e.g. the cyclopropyl analogue of chlorpromazine, had been described in patent literature^{18,19} but were generally designated as coronary dilatants, spasmolytics and compounds with a central depressant activity. At the same time it was to be expected that the instability of the cyclopropane ring might make some of the synthetic steps rather difficult.

The starting compound used was cyclopropylbenzene which had been prepared according to Corbin and coworkers²⁰ by an intramolecular debromination of 1,3-dibromon-1-phenylpropane with the aid of a Zn-Cu-couple²¹. The authors carried out the reaction at $7-9^{\circ}C$. We observed while working in larger batches that under these conditions the reaction does not proceed with a low concentration of the dibromo derivative while after reaching higher concentrations it may

have the tendency to proceed too vigorously. It was found here that this difficulty can be overcome by working at 50°C. At the same time, the dibromo derivative must be added dropwise and very slowly to the mixture of the Zn-Cu-couple and dimethylformamide to maintain the low concentration of the starting compound. If it is added more rapidly an intermolecular debromination in the more reactive α -positions takes place as documented by the identification of *meso*-3,4-diphenylhexane (XIX) (ref.²²) in one of the experiments (debromination in the terminal positions probably takes place only during processing the reaction mixture).

Cyclopropylbenzene was converted by bromination at -70° C selectively and in a high yield to 4-cyclopropylbromobenzene²³ (see also ref.²⁴). The compound reacts with magnesium in ether smoothly to the Grignard reagent (ref.²⁵) which reacts with sulfur, giving rise to the novel 4-cyclopropylthiophenol (XX). Preparation of the analytically pure compound appeared to be difficult and hence the product was characterized by gentle oxidation to the crystalline di(4-cyclopropylphenyl) disulfide (XXI). Application of method A to the crude thiol XX yields readily the acid IXe. In view of the fact that during homologization of acid *IXe* to acid *XIIIe* by the usual procedure difficulties could be expected (particularly with method C), a modified procedure was preferred²⁶: the thiol XX was converted to the acid XIIIe by direct condensation with 2-(2-iodophenyl)acetic acid^{26,27}. Attempts at cyclization of XIIIe by the usual methods, i.e. with the aid of sulfuric acid, polyphosphoric acid, hydrofluoric acid or phosphorus pentoxide in toluene or xylene were not successful, apparently due to the instability of the cyclopropane ring in these media. On the other hand, cyclization proceeds relatively readily in trifluoroacetic anhydride²⁸⁻³⁰. Even in this case, the product formed is not homogeneous but chromatography on alumina permits the isolation of about 50% of the desired crystalline ketone in a pure state, the identity having been confirmed by analysis and spectra and finally by conversion to the 2,4-dinitrophenylhydrazone. In further steps of synthesis of Ie we used methods G, H and J. During treatment of alcohol XVe (method H) with hydrogen chloride no damage to the cyclopropane ring was observed.

In the cyclopentyl series (f) the starting compound was cyclopentylbenzene, obtained best by a Friedel-Crafts reaction of benzene with cyclopentanol³¹. The usual chlorosulfonation yielded the novel 4-cyclopentylbenzenesulfonyl chloride (XXII) which was converted for characterization to the sulfonamide XXIII. Reduction of the sulfonyl chloride with lithium aluminium hydride yielded 4-cyclopentylthiophenol (XXIV) which was processed further by application of general procedures.

Collection Czechoslov, Chem. Commun. (Vol. 39) (1974)

Valenta, Metyšová, Šedivý, Protiva:

The above 2-(4-cyclopropylphenylthio)benzoic acid (IXe) was used for the synthesis of the hitherto unknown cyclopropyl analogue of the neuroleptic chlorprothixene³². Cyclization with the aid of trifluoroacetic anhydride yielded 2-cyclopropylthioxanthone (XXV) which reacted with 3-dimethylaminopropylmagnesium chloride in tetrahydrofuran to the tertiary alcohol XXVI. Its dehydration with boiling 20% sulfuric acid gave rise to the olefin XXVII, probably as a mixture of geometric isomers. Repeated crystallization of hydrogen maleate yielded a probably homogeneous compound but its configuration at the double bond cannot be determined.

Most of the prepared piperazine derivatives *I*, *II*, *IV* and *VII* and the thioxanthene derivative *XXVII* were tested pharmacologically with a view to the assumed central depressant and neuroleptic activity (for methods see ref.³³) in the form of salts, the values shown referring to bases. The results obtained are shown in Table II which inculdes as standards octoclothepin (*I*, $\mathbb{R}^1 = \mathbb{C}[1)$ *i.e.* 8-chloro-10-(4-methylpiperazino)-10,11-dihydrodibenzo[*b*,*f*]thiepin (for parenteral administration as methanesulfonate⁵, for oral application as maleate³⁴), and further chlorprothixene, *i.e.* cis-2-chloro-9-(3-dimethylaminopropylidene)thioxanthene³⁵ (*p.o.* as hydrochloride, parenterally as methanesulfonate³²). Besides tests of acute toxicity for mice, the compounds were evaluated in the rotating-rod test (effect on motor coordination) in mice and for assessing the neuroleptic activity their cataleptic effect in rats was examined. The results are shown in the table as the usual mean lethal doses LD₅₀ as well as in the form of the mean effective doses (ED₅₀), in mg/kg throughout.

Table II shows that ethyl, isopropyl and cyclopropyl are suitable 8-substituents from the point of view of central depressant and cataleptic activity in the series of neuroleptic 10-piperazinodibenzo[b,f] thiepins. Highly effective are especially N-methyl derivatives I, N-(3-hydroxypropyl) derivatives II and enamines VII. In the rotating rod test, none of the compounds exceeds the effect of octoclothepin even if some of them are almost equal to it (Ia, Ie, IIa). On the other hand, in the catalepsy test, it is surpassed by a number of compounds (Ia, Ib, IIa, IIb, VIIb) and others are almost equal to it (Ie, IIf). In contrast with octoclothepin, some compounds display a dissociation of the depressant from the cataleptic activity in favour of the latter which makes them to potential neuroleptics with decreased depressant activity. Of the highly effective compounds, this dissociation is best exhibited by the enamine of the isopropyl series (VIIb) which is 4 times weaker as a depressant but 14 times more

794

effective as a cataleptic than octoclothepin. Of the medium-potent compounds the hydroxyl derivative of the isopropyl series *IIb* is 8 times weaker as a depressant and more than twice more effective as a cataleptic than octoclothepin. The cyclopropyl analogue of chlorprothixene (compound *XXVII*) retains some depressant activity but is completely ineffective cataleptically. It cannot be excluded, however, that the compound tested actually belongs to the practically inactive *trans* series.

Esters Vb and Vc in the form of di(hydrogen maleates) have been tested so far by methods of general pharmacological screening at the affiliated unit of this institute at Rosice n/L (Dr J. Němec). Both were applied p.o. Their LD₅₀ are greater than 1 g/kg and the compounds were applied *in vivo* in doses of 300 (Vb) or 200 (Vc) mg/kg. Both bring about signs of central depression, have cataleptic, antiamphetamine, and hypothermic activity and they potentiate thiopental narcosis. Further they display an antihistamine effect and, at higher doses, they depress the blood pressure and are antiinflammatory. In general, they thus behave also as neuroleptics.

Antimicrobial	Activity	of Prepared	Compounds	in	vitro

^a Minimum inhibitory concentration in μ g/ml. Unless a numerical value is given, the compound at 125 μ g/ml causes no inhibition. ^b MS methanesulfonate, M maleate, HM hydrogen maleate. ^c Streptococcus β-haemolyticus, 2 Streptococcus β-haemolyticus WARD, 3 Staphylococcus pyogenes aureus, 4 Staphylococcus pyogenes aureus penicillin-resistant, 5 Klebsiella pneumoniae, 6 Mycobacterium tuberculosis H37Rv. 7 Saccharomyces pasterianus, 8 Trichophyton mentagrophytes, 9 Candida albicans, 10 Aspergillus niger.

In view of the antimicrobial activity of other derivatives of 10-piperazinodibenzo[b, f]thiepins³⁶ the compounds described here were tested at the bacteriological department of this institute (Dr A. Šimek, Dr J. Turinová) *in vitro* for their inhibitory activity toward 14 representative types of microorganisms. Table III shows the minimum found inhibitory concentrations in $\mu g/ml$. It should be noted that all the compounds up to a concentration of 125 $\mu g/ml$ were inactive toward *Pseudomonas aeruginosa*, *Escherichia coli*, *Salmonella typhi abdominalis* and *Proteus vulgaris*. Table III shows the 8-n-butyl derivatives (*Ic*, *IIc*, *VIIc*) and the 8-cyclopentyl derivatives (*If*, *IIf*) to be relatively highly bacteriostatic, particularly toward cocci; they are more potent than the corresponding ethyl, isopropyl and cyclopropyl derivatives. This led to the preparation of possible dissociation of central from antimicrobial activity with extending the alkyl chain in position 8 was not confirmed.

EXPERIMENTAL

The melting points of analytical preparations were determined in Kofler's block and are not corrected; the samples were dried for 8 h at a suitable temperature (100°C maximum) at oil-pump vacuum over P_2O_5 . The UV spectra (in methanol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded otherwise were recorded in a Unicam SP 700 spectrophotometer, the IR spectra (in Nuiol unless stated otherwise) were recorded otherwise were recorded othe

TABLE III

otherwise) in a Unicam SP 200 G or in an Infrascan (Hilger and Watts) spectrophotometer, the NMR spectra (in CDCl₃ unless stated otherwise) in a ZKR 60 (Zeiss, Jena) spectrometer. The mass spectrum was obtained in a MS 902 (AEI) mass spectrometer.

4-Cyclopentylbenzenesulfonyl Chloride (XXII)

Chlorosulfonic acid (285 g) was added dropwise under stirring at $4-8^{\circ}$ C over a period of 45 min to a solution of 90 g cyclopentylbenzene³¹ (b.p. 114–116°C/25 Torr) in 300 ml chloroform. The mixture was stirred for another hour at 10°C and then decomposed with ice and water. The product was isolated by extraction with chloroform. A total of 90 g (60%) crude sulfonyl chloride was obtained (residue), a sample of which was recrystallized for analysis from light petroleum; m.p. 52–54°C. IR spectrum: 838 (2 vicinal aromatic C—H), 1180 and 1385 (SO₂Cl), 1595 cm⁻¹ (Ar). NMR spectrum: δ 8·00 (mcd, 2 H, aromatic protons in the vicinity of SO₂Cl), 7·50 (mcd, 2H, remaining aromatic protons), 2·85–3·35 (m, 1H, CH—Ar), 1·25–2·40 (m, 8H, CH₂ groups of cyclopentane). For C₁₁H₁₃ClO₂S (244·7) calculated: 53·98% C, 5·35% H, 14·49% Cl, 13·10% S; found: 53·87% C, 5·32% H, 14·49% Cl, 12·92% S.

4-Cyclopentylbenzenesulfonamide (XXIII)

A mixture of 1-5 g sulfonyl chloride XXII and 15 ml concentrated aqueous ammonia was heated under stirring for 20 min to 65–70°C and then left for 2 h at room temperature. The precipitated product was filtered and recrystallized from aqueous ethanol; m.p. $124-125^{\circ}$ C. NMR spectrum: δ 7.89 (mcd, 2H, J = 9.0 Hz, aromatic protons in the vicinity of SO₂NH₂), 7.38 (mcd, J = 9.0 Hz, 2H, remaining aromatic protons), 5:24 (s, 2H, SO₂NH₂), 3:00 (m, 1H, CH—Ar), 1:50–2:30 (m, 8H, 4CH₂ of cyclopentane). For C₁₁H₁₅NO₂S (225:3) calculated: 58:63% C, 6:71% H, 6:22% N, 14:23% S; found: 59-00% C, 6:74% H, 6:31% N, 14:49% S.

Cyclopropylbenzene

A. Crude 1-phenyl-1,3-dibromopropane²⁰ (69.5 g) was added dropwise under stirring at about 50°C over the period of 60 min to a mixture of 125 ml dimethylformamide and the Zn--Cu-couple (prepared from 32 g zinc and 100 ml 2% solution of cupric sulfate)²¹. The mixture was processed according to ref.²⁰ and a total of 23.9 g (84%) product was obtained: b.p. $58-62^{\circ}$ C/7 Torr.

B. A double batch was carried out at 58-60°C and 1-phenyl-1,3-dibromopropane was added dropwise over 30 min. The mixture was decomposed with water²⁰, steam-distilled and the product was isolated by extraction with ether. After distilling off the cyclopropylbenzene a residue of 10-6 g was obtained, m.p. 90-92°C (cyclohexane). According to analysis and NMR spectrum we are dealing here with meso-3,4-diphenylhexane (X1X) with a reported²² m.p. of 92-93°C. NMR spectrum: δ 7-25 (m, 10H, aromatic protons), 2-55 (m, 2H, CH--CH), c. 1-30 (m, 4H, 2CH₂), 0-48 (t, J = 7-0 Hz, 6H, 2CH₃). For C₁₈H₂₂ (238-4) calculated: 90-70% C, 9-30% H; found: 90-70% C, 9-56% H.

4-Isopropylthiophenol

....

A solution of 700 g crude 4-isopropylbenzenesulfonyl chloride³ in 800 ml acetic acid was added dropwise over 1 h to a boiling mixture of 1320 ml acetic acid, 300 g red phosphorus and 17 g iodine and the mixture was refluxed under stirring for 3 h. After cooling, it was combined slowly with 400 ml water, the mixture was refluxed for 1 h and, after cooling, it was poured into 10 licecold

water. The product was isolated by extraction with chloroform and redistilled; $424 \pm (87\%)$, b.p. $100-103^{\circ}C/12$ Torr. For a product prepared differently a b.p. of $104^{\circ}C/15$ Torr was reported³.

4-n-Octylthiophenol

Similarly to the preceding case, 127 g crude 4-n-octylbenzenesulfonyl chloride¹⁶ was reduced with 24 g red phosphorus and 19 g iodine in 160 ml boiling acetic acid. Analogous treatment (extraction with benzene) led to 63·4 g (64%) product boiling at 124–130°C/0·3 Torr. Literature¹⁵ reports a b.p. of $136-137^{\circ}C/2$ ·3 Torr. for the compound prepared differently.

4-n-Dodecylthiophenol (XVII)

n-Dodecylbenzene¹⁷ (29-6 g; b.p. 186–190°C/15 Torr) was added dropwise under stirring over 45 min to 26 ml chlorosulfonic acid at 5–10°C, the mixture was stirred for 4 h at room temperature and then was left to stand overnight. After decomposition with ice and water the crude 4-(n-dodecyl)benzensulfonyl chloride (35 g) was isolated by extraction with ether and evaporation of the extract. The total amount of the product was then reduced similarly to preceding cases with the aid of 6·4 g red phosphorus and 3·4 g iodine in 45 ml boiling acetic acid. Analogous treatment yielded 17-7 g (68%) product boiling at 177–181°C/0·7 Torr. For analysis, a redistilled middle fraction was used; b.p. 162–163°C/0·6 Torr. For C₁₈H₃₀S (278·5) calculated: 77·63% C, 10·86% H, 11·64% S.

4-n-Butylthiophenol

A solution of 23·2 g crude 4-n-butylbenzenesulfonyl chloride³ in 200 ml ether was added dropwise over 1h to a suspension of 9·45 g LiAlH₄ in 100 ml ether and the mixture was refluxed for 2 h. After cooling, 150 ml water-saturated ether was added, followed with 400 ml 2·5m-HCL. After filtration, the ether phase was separated, the aqueous phase was extracted with ether, the ether solutions were dried with MgSO₄ and distilled; 9·0 g (55%), b.p. 130–135°C/30 Torr, or 120–125°C/20 Torr. For a compound prepared differently ref.³ reported a b.p. of 119°C/14 Torr.

4-Cyclopentylthiophenol (XXIV)

As in the preceding case, 194 g sulfonyl chloride XXII was reduced with 75 g LiAlH₄ and the almost theoretical yield (130 g) of a crude residue was used for further work. Sample for analysis was distilled; b.p. 165° C/25 Torr. For C₁₁H₁₄S (178·2) calculated 74·13% C, 7·92% H, 17·96% S; found: 74·14% C, 7·81% H, 17·61% S.

4-Cyclopropylthiophenol (XX)

A Grignard reagent was prepared from 6.4 g Mg and 49.4 g 4-cyclopropylbromobenzene²³ (b.p. 102°C/7 Torr) in 140 ml ether, using several drops of 1,2-dibromoethane for initiating the reaction. The preparation of the reagent took 9 h. After dilution with 80 ml ether the solution was combined over 4 h at room temperature with 6.5 g sulfur flowers. The suspension was stirred for 1 h at room temperature and then refluxed for 1 h. After standing overnight it was diluted with 100 ml ether and slowly poured into 280 ml water and 50 ml hydrochloric acid. Processing of the ether layer yielded 17.5 g (47%) product boiling at 110–116°C/12 Torr, which, even after redistillation, does not yield satisfactory analytical values. However, it was processed further without difficulties. For C₉H₁₀S (150·2) calculated: 71.95% C, 6.71% H, 21·34% S; found: 72·73% C, 6.63% H, 20·38% S.

Di(4-cyclopropylphenyl)disulfide (XXI)

Thiol XX (1.5 g) was added to 15 ml 1M-NaOH and, under stirring at 5°C, this was followed with 1:1 ml 30% H_2O_2 in 9 ml water. The precipitate formed was filtered, washed with water and dried; 1:2 g (81%), m.p. 71–72-5°C (light petroleum). IR spectrum (KBr): 823 (2 vicinal aromatic C-+H), 1498 and 1600 cm⁻¹ (Ar). NMR spectrum: δ 7-44 (d, J = 9.0 Hz, 4H, aromatic protons in the vicinity of S), 7-00 (d, J = 9.0 Hz, 4H, remaining aromatic protons), 1.45–2.10 (m, 2H, 2CH—Ar), 0.40–1.15 (m, 8H, 4CH₂ of cyclopropyls). For $C_{18}H_{18}S_2$ (298-5) calculated: 72-43% C, 607% H, 21-50% S; found: 72-59% C, 612% H, 21-45% S.

2-(4-Cyclopropylphenylthio)benzoic Acid (IXe) (Method A)

Thiol XX (7.5 g) was added to a solution of 10.8 g KOH in 110 ml water at 50°C, the mixture was stirred for a while and then 0.45 g "molecular" copper and 12.5 g 2-iodobenzoic acid⁴ was added and the mixture was refluxed under stirring for 7 h. It was filtered while hot with charcoal and the filtrate was cooled and acidified with 2.5M-HCl. The precipitated product was filtered, washed with water and recrystallized from aqueous ethanol; 10.6 g (80%), m.p. 192–194°C. IR spectrum (KBr): 734 (4 vicinal aromatic C—H), 815 (2 vicinal aromatic C—H), 1252 (C—O), 1672 cm⁻¹ (Ar—COOH). NMR spectrum: δ 12.00 (bs, disappears after D₂O, 1H, COOH), 8.16 (m, 1H, aromatic 6-H), 7.50 (d, J = 9.0 Hz, 2H, aromatic 2', 6'-H₂), 7.13 (d, J = 9.0 Hz, 2H, aromatic 3', 5'-H₂), c. 7.10 (m, 2H, aromatic 4,5-H₂), 6.80 (m, 1H, aromatic 3-H), 1.90 (m, 1H, CH—Ar), 0.60–1.20 (m, 4H, 2CH₂ of cyclopropane). The analytical data are shown in Table I.

2-(4-Isopropylphenylthio)benzyl Alcohol (Xb) (Method B)

770 ml of a 70% benzene solution of sodium bis(2-methoxyethoxy)dihydroaluminate were added dropwise under stirring over 2 h to a solution of 362 g acid *IXb* (ref.³) in 2800 ml benzene. The temperature rose spontaneously to 40°C. The mixture was stirred for 3 h at room temperature and then decomposed under external cooling by adding dropwise 2000 ml 10% NaOH. The benzene phase was separated and the aqueous one extracted with more benzene. Usual treatment of the organic phases yielded 324 g (94%) product boiling at 170-170*5C/1*5-2 Torr. IR spectrum: 752 (4 vicinal aromatic C—H), 822 (2 vicinal aromatic C—H), 1015 (CH₂OH), 1360 (isopropy), 1590 (Ar), 3370 cm⁻¹ (OH). The analytical data are shown in Table I.

2-(4-n-Octylphenylthio)benzyl Alcohol (Xd)

Acid *IXd* (6.85 g) was added in parts under stirring to a suspension of 2-0 g LiAlH₄ in 40 ml ether and the mixture was refluxed for 6 h. It was cooled, decomposed by adding dropwise 7-5 ml water and 2 ml 20% NaOH, stirred for 30 min, the solid was filtered, the filtrate was dried with Na₂SO₄ and evaporated. A total of 5-8 g (88%) crude product was obtained, the sample of which was redistilled for analysis; b.p. 195°C/0·4 Torr. The analytical data are shown in Table I.

2-(4-Cyclopentylphenylthio)benzyl Chloride (XIf) (Method C)

 $SOCI_2$ (18 g) was added dropwise under stirring at room temperature over a period of 15 min to a solution of 28.4 g alcohol X/ in 40 ml benzene and the mixture was refluxed for 30 min. After evaporation of excess $SOCI_2$ and benzene the product was distilled; 24.2 g (80%), b.p. 180 – 182°C/1 Torr or 210 – 215°C/3 Torr. The analytical data are shown in Table I.

2-(4-Isopropylphenylthio)phenylacetonitrile (XIIb) (Method D)

A solution of 18.6 g chloride X*lb* in 35 ml ethanol was added to a solution of 9.1 g KCN in 13 mt water and the mixture was refluxed for 7 h. After cooling, it was diluted with 200 ml water and the product was isolated by extraction with ether; 15.5 g (86%), b.p. 158–162°C/1 Torr. NMR spectrum: δ 7.15–7.70 (m, 8H, aromatic protons), 3.84 (s, 2H, ArCH₂CN), 2.86 (d, J = 7.0 Hz, 1H, Ar–CH), 1.21 (d, J = 7.0 Hz, 6H, 2CH₃). The analytical data are shown in Table I.

2-(4-Ethylphenylthio)phenylacetic Acid (XIIIa) (Method E)

A mixture of 123 g nitrile XIIa, 850 ml ethanol and 136 g KOH in 125 ml water was refluxed for 5 h. After partial cooling, it was diluted with 1250 ml water (50°C), the mixture was filtered with charcoal and the filtrate made acid with excess dilute hydrochloric acid. The precipitated acid was filtered, washed with water and recrystallized from aqueous ethanol; 110 g (83%), m.p. $96-99^{\circ}C$. IR spectrum (KBr): 745 (4 vicinal aromatic C—H), 823 (2 vicinal aromatic C—H), 930, 1244, 1407, 1692 and 2600 cm⁻¹ (COOH). The analytical data are shown in Table I.

2-(4-Cyclopropylphenylthio)phenylacetic Acid (XIIIe)

Thiol XX (9.7 g) was added to a solution of 13.8 g KOH in 140 ml water at 40°C, the mixture was stirred for 5 min, 0.9 g "molecular" copper and 16.2 g 2-(2-iodophenyl)acetic acid^{26,27} was added and the mixture refluxed under stirring for 4 h. After standing overnight, 0.3 g copper was added and refluxing continued for 7 h. It was filtered while hot with charcoal and the filtrate was made acid with hydrochloric acid at 70°C to pH 1. The precipitated product was filtered, washed with water and dried; 16.8 g (96%), m.p. 122–122.5°C (aqueous ethanol). IR spectrum (CHCl₃): 820 (Ar—H), 1492 and 1590 (Ar), 928, 1235 and 1705 cm⁻¹ (COOH). NMR spectrum: δ 7.31 (s, 4H, aromatic protons in positions 2', 3', 5', 6'), 3.80 (s, 2H, ArCH₂COO), 1.80 (m, 1H, Ar—CH), 0.50–1.15 (m, 4H, 2CH₂ of cyclopropane). The analytical data are shown in Table I.

8-Isopropyldibenzo[b,f]thiepin-10(11H)-one (XIVb) (Method F)

Acid XIIIb (14.3 g) was added at 100°C to 30 g polyphosphoric acid and the mixture was heated under stirring for 2 h to 150°C. After cooling, 60 ml benzene was added and the mixture decomposed under cooling with 60 ml water. The product was isolated by extraction with benzene, the extract was washed with 5% NaOH and water, dried with K_2CO_3 and evaporated. The crude product was distilled; 10.2 g (76%), b.p. $167-170^{\circ}C/1.5$ Torr. UV spectrum: λ_{max} 242.5 nm (log *a* 4.33), 335 nm (3·63), infl. 265 nm (4·07). IR spectrum (film): 748 (4 vicinal aromatic C-H), 838 (2 vicinal aromatic C-H), 1290 (C-O), 1360 (isopropyl), 1584 (Ar), 1675 cm⁻¹ (Ar-CO). The analytical data are shown in Table I.

8-n-Butyldibenzo[b,f]thiepin-10(11H)-one (XIVc) (Method F-1)

Acid XIIIc (60 g) was added to a hot mixture of 540 g polyphosphoric acid and 180 ml toluene and the mixture was refluxed under stirring for 2 h. After cooling, 500 ml benzene was added and decomposed with 750 ml ice-cold water. The organic phase was washed with water and 5% NAOH (acidification of the alkaline solution recovered 12 o g acid XIIIc), dried with K_2CO_3 and processed by distillation; 37 g (82%), b.p. 190–195°C/2 Torr. UV spectrum: λ_{max} 241 nm (log ε 4-29), 334 nm (3·55). IR spectrum: 745, 752 (4 vicinal aromatic C—H), 828 (2 vicinal aromatic C—H)

870 (solitary aromatic C—H), 1075 and 1288 (C—O), 1595 (Ar), 1670 cm⁻¹ (Ar—CO). NMR spectrum: δ 8.06 (d, J = 2.5 Hz, 1H, aromatic 9-H), 7.00–7.30 (m, 6H, remaining aromatic protons), 4.34 (s, 2H, ArCH₂CO), 2.59 (t, J = 7.0 Hz, 2H, ArCH₂ of butyl), c. 1.45 (m, 4H, C—CH₂CH₂—C of butyl), 0.88 (t, 3H, CH₂). The analytical data are shown in Table I.

8-Cyclopropyldibenzo[b,f]thiepin-10(11H)-one (XIVe)

A mixture of 80 ml trifluoroacetic anhydride and 13·2 g acid XIIIe was stirred for 4 h at room temperature. After standing overnight, 6 ml benzene were added and the mixture refluxed for 7 h, diluted with 25 ml benzene and decomposed with 11 12% NaHCO₃. The mixture was extracted with benzene and the extract was evaporated. The residue was dissolved in benzene and chromatographed on a column of alumina (300 g, activity II). Elution with benzene yielded 6·8 g (55%) XIVe, m.p. 82-86°C; after recrystallization from cyclohexane, m.p. 85-86°C. UV spectrum: λ_{max} 242·5 nm (log é 4·39), 260 nm (4·15), 342 nm (3·60). IR spectrum (KBr): 755 (4 vicinal aromatic C—H), 842 (2 vicinal aromatic C—H), 878 (solitary aromatic C—H), 1475 and 1600 (Ar), 1670 cm⁻¹ (Ar—CO). NMR spectrum: δ 8·06 (d, $J = 2\cdot5$ Hz, 1H, aromatic 9-H), 7·63 (d, $J = 9 \cdot 0$ Hz, 1H, aromatic 6-H), 7·21 (mcd, $J = 9 \cdot 0$; 2·5 Hz, 1H, aromatic 9-H), 7·25 -7·90 (m, 4H, remaining aromatic protons), 4·40 (s, 2H, ArCH₂CO), 1·88 (m, 1H, Ar—CH), 0·50-1·15 (m, 4H, 2CH₂ of cyclopropane). The analytical data are shown in Table 1.

8-n-Butyl-10-hydroxy-10,11-dihydrodibenzo[b,f]thiepin (XVc) (Method G)

A solution of 11 4 g NaBH₄ with 0.65 ml 20% NaOH in 65 ml water was added dropwise over 1 h under stirring to a solution of 29 0 g ketone XIVe in 400 ml ethanol, the mixture was refluxed for 4 h, the ethanol was evaporated at reduced pressure, the residue was diluted with 400 ml water and the product was extracted with benzene. The extract was washed with water, 5% NaOH, dried and evaporated. The residue crystallized from a mixture of benzene and light petroleum; 24 g (82%), m.p. 62-63°C. IR spectrum (KBr): 743 (4 vicinal aromatic C-H), 820 (2 vicinal aromatic C-H), 867 and 882 (solitary aromatic C-H), 1047 (CHOH), 992, 1465 (Ar), 3280 and 3330 cm⁻¹ (OH). NMR spectrum: $\delta 680 - 7.60$ (m, 7H, aromatic protons), 5-25 (m, dd after D₂O, J = 9.0; 4-0 Hz, 1H, Ar-CH-O), 3-73 and 3-28 (2dd, J = 14.0; 4-0 Hz and 14-0; 4-0 Hz, 2H, ArCH₂ in a ring), 2-53 (t, J = 7.0 Hz, 2H, ArCH₂ of butyl), 2-15 (d, disappears after D₂O, 1H, OH), 1-42 (m, 4H, C-CH₂CH₂-C of butyl), 0-88 (t, 3H, CH₃). The analytical data are shown in Table I.

8-Cyclopropyl-10-chloro-10,11-dihydrodibenzo[b,f]thiepin (XVIe) (Method H)

Powder CaCl₂ (5 g) was added to a solution of 6·9 g alcoholXVe in 90 ml benzene and the suspension was saturated at room temperature with anhydrous HCI for 3 h. After standing overnight, it was filtered and the filtrate was evaporated at reduced pressure. The residue crystallized from cyclohexane; 7·10 g (97%), m.p. 76·5-77°C. NMR spectrum: δ 7·05-790 (m, 6H, aromatic protons in positions 1, 2, 3, 4, 6 and 9), 6·90 (mcd, $J = 9\cdot0$; 2·5 Hz, 1H, aromatic proton in position 7), 5·85 (dd, $J = 9\cdot0$; 4·0 Hz, 1H, Ar-CH-Cl), 4·02 and 3·65 (2dd, $J = 14\cdot0$; 4·0 and 14·0; 9·0 Hz, 2H, ArCH₂ in the ring), 1·85 (m, 1H, Ar-CH of cyclopropane), 0·50-1·10 (m, 4H, 2CH₂ of cyclopropane).

8-Isopropyl-10-(4-methylpiperazino)-10,11-dihydrodibenzo[b,f] thiepin (Ib) (Method J)

1-Methylpiperazine (7.5 g) was added to a solution of 7.2 g chloride XVIb in 8 ml chloroform and the mixture was refluxed for 6 h. After evaporation of the chloroform the residue was dissolved in 100 ml benzene, the solution was washed with 2 5M-NaOH and with water. The base was then transferred by shaking with 3 times 70 ml $1\cdot25M-H_2SO_4$ to the aqueous phase. Evaporation of the separated benzene phase and distillation of the residue yielded a small amount of 2-iso-propyldibenzo[δ_f]thiepin (*VIIIb*), b.p. 177–180°C/1-5 Torr. UV spectrum: λ_{max} 221 nm (log ϵ 4-43), 261 nm (4-39), 297 nm (3-72). IR spectrum: 746 (4 vicinal aromatic C—H), 786 (*cis*-CH==CH), 826 (2 vicinal aromatic C—H), 880 (solitary aromatic C—H), 1061, 1553, 1589 cm⁻¹ (Ar). NMR spectrum: δ 7-00–7-60 (m, 7H, aromatic protons), 6-99 (s, 2H, olefinic CH=CH), 2-80 (m, 1H, Ar—CH of isopropyl), 1-18 (d, J = 7-0 Hz, 6H, 2CH₃). The analytical data are shown in Table I.

The acid aqueous phase was made alkaline with excess aqueous NH_4OH and the liberated base was isolated by extraction with benzene; 8.0 g (91%). It crystallized on standing, m.p. 118 to 120°C (benzene-light petroleum). NMR spectrum: δ 7.55 (d, J = 2.5 Hz, 1H, aromatic 9-H), 7.00-7.50 (m, 5H, aromatic protons in positions 1, 2, 3, 4, 6), 6.93 (mcd, 1H, aromatic 7-H), 3.00-4.00 (m, 3H, Ar-CH₂CH-Ar), c. 3.00 (obscured m, 1H, Ar-CH of isopropy), 2.64 (m, 4H, CH₂N³CH₂ of piperazine), 2.51 (m, 4H, CH₂N⁴CH₂ of piperazine), 2.30 (s, 3H, NCH₃), 1.18 (d, J = 7.0 Hz, 6 H, 2 CH₃ of isopropy). Further data are in Table 1.

8-Ethyl-10-piperazino-10,11-dihydrodibenzo[b,f]thiepin (IVa) (Method K)

A mixture of 12·0 g carbamate *IIIa*, 17 ml ethanol and 8·4 g KOH was refluxed for 3 h in a 120°C bath. It was then cooled, dissolved in 60 ml water and extracted with benzene. After washing and drying of the extract, the benzene was evaporated and the residue recrystallized from 12 ml ethanol; 8·2 g (84%), m.p. 113–114°C (acetone). NMR spectrum: δ 7·00–8·50 (m, 7H, aromatic protons), 2·95–4·00 (m, 6 H, ArCH₂CHAr, ArCH₂ and NH), 2·30–2·95 (m, 8 H, CH₂ groups of piperazine), 1·14 (t, 3 H, C—CH₃ of ethyl). Further data are contained in Table I.

8-Ethyl-10-[4-(3-capryloyoxypropyl)piperazino]-10,11-dihydrodibenzo[b,f]thiepin (Va) (Method L)

Capryloyl chloride⁹ (10.5 g, b.p. $105^{\circ}C/35$ Torr) was added to a solution of 11.4 g aminoalcohol *IIa* in a mixture of 60 ml benzene and 20 ml chloroform, the mixture was stirred and left to stand for 4 days at room temperature. It was then heated for 1 h to $60^{\circ}C$, cooled, 100 ml water was added, made alkaline with ammonia and extracted with benzene. Processing of the extract yielded the crude base which was dissolved in 35 ml acetone and neutralized with a solution of 6.9 g maleic acid in 25 ml acetone. A total of 13.0 g (59%) crystalline di(hydrogen maleate) was obtained; m.p. 144–146°C (acetone). The analytical data are shown in Table I.

8-n-Butyl-10-(4-methylpiperazino)dibenzo[b,f]thiepin (VIIc) (Method M)

1-Methylpiperazine (15 g) was added to a solution of 8·5 g ketone XIVc in 70 ml benzene, followed over a period of 5 min with a solution of 3·0 g TiCl₄ in 20 ml benzene. The mixture was refluxed under stirring for 24 h. After cooling, it was decomposed with 100 ml water, the inorganic fraction was filtered and the filtrate processed by benzene extraction. Washing of the extract with water and evaporation yielded the crude base, which was recrystallized from benzene; 6·2 g (57%), m.p. 140–141°C. NMR spectrum: δ 7·00–7·65 (m, 7 H, aromatic protons), 6·34 (s, 1 H, Ar––CH=C), 3·00 and 2·55 (2 m, 10 H, ArCH₂ of butyl and 4 CH₂ of piperazine), 2·36 (s, 3 H, NCH₃), 1·40 (m, 4H, C–CH₂CH₂–C of butyl), 0·90 (t, 3 H, CH₃ of butyl). Further data are included in Table I.

2-Cyclopropylthioxanthone (XXV)

A mixture of 11.4 g acid *IX*e and 100 g trifluoroacetic anhydride was stirred for 5 h at 35°C. After standing overnight, 120 ml of benzene was added and the mixture was stirred for 8 h at 35°C. After cooling, it was decomposed by pouring into 500 ml 10% NaHCO₃, 100 ml benzene was added, followed with 30 ml 5M-NaOH. After separation, acidification of the alkaline layer recovered 4.1 g acid *IX*e. The benzene layer was washed with water, dried with Na₂SO₄ and evaporated. A total of 3.8 g (57%) crude product melting at 95–98°C was obtained. For analysis it was recrystall zed from a mixture of benzene and light petroleum, m.p. 104–106°C (change of the crystal modification at 95°C). The mass spectrum shows a molecular ion at m/e = 252 which corresponds to the assumption; the fragmentation is in agreement with the expected structure. For C₁₆H₁₂OS (252·3) calculated: 75·15% C, 4·80% H, 12·71% S; found: 76·07% C, 5·01% H, 12·70% S.

2-Cyclopropyl-9-(3-dimethylaminopropyl)thioxanthene-9-ol (XXVI)

Reaction of 0.8 g Mg and 4.06 g 3-dimethylaminopropyl choride in 15 ml tetrahydrofuran produced a Grignard reagent, using a grain of iodine and several drops of 1,2-dibromoethane for initiating the reaction. The preparation of the reagent took 3 h. After cooling, a suspension of 4.0 g ketone XXV in 25 ml tetrahydrofuran was added and the mixture was left to stand for 3 days at room temperature. It was then decomposed with 100 ml 20% NH₄Cl and extracted with benzene. Processing of the extract yielded 4.7 g (87%) crude product which was recrystallized for analysis from a mixture of cyclohexane and light petroleum, m.p. 123–125.5°C. Its spectrum (CHCl₃): 770 (4 vicinal aromatic C—H), 820 (2 vicinal aromatic C—H), 900 (solitary aromatic C—H), 1020 (C—OH), 1596 (Ar), 2630 and 2700 cm⁻¹ (OH in a hydrogen bond at N). NMR spectrum: δ 8-02 (m, 1 H, aromatic 8-H), 7.75 (d, J = 3·0 Hz, 1 H, aromatic 1-H), 7.10–7.60 (m, 4 H, aromatic protons in positions 4, 5, 6, 7), 6·98 (mcd, J = 9·0; 3·0 Hz, 1 H, aromatic 3-H), 2·40 (s, 6 H, 2 N—CH₃), 1·60–2·40 (m, 5 H, Ar—CH of cyclopropyl and CH₂—C—CH₂N of the side chain), 0·50–1·40 (m, 6 H, 2 CH₂ of cyclopropyl and C—CH₂—C of the side chain). For C₂₁H₂₅SNOS (339·5) calculated: 74·29% C, 7·42% H, 4·12% N, 9·46% S; found: 73·82% C, 7·69% H, 4·08% N, 9·23% S.

2-Cyclopropyl-9-(3-dimethylaminopropylidene)thioxanthene (XXVII)

A mixture of 125 ml water, 35 g H_2SO_4 and 8·25 g aminoalcohol XXVI was refluxed for 2 h, cooled, made alkaline with NH_4OH and the product was isolated by extraction with chloroform. The crude base (7·8 g) was converted by neutralization with maleic acid (2·9 g) in 2-propanol to the crystalline hydrogen maleate (9·2 g) which, after several recrystallizations from a mixture of 2-propanol and ether melted at 140–143°C. UV spectrum: λ_{max} 231 nm (log ε 4·55), 271·5 nm (4·18), 329·5 nm (3·50). IR spectrum (KBr): 755 (4 vicinal aromatic C—H), 835 (2 vicinal aromatic C—H), 892 (solitary aromatic C—H), 1460 (Ar), 1528 and 1615 (COO⁻), 2460 cm⁻¹ (NH⁺). For C₂₅H₂₇NO₄S (437·5) calculated: 68·62% C, 6·22% H, 3·20% N, 7·33% S; found: 68·28% C, 6·52% H, 3·24% N, 7·31% S.

The authors are indebted to Drs B. Kakáč, E. Svátek, J. Holubek and Mrs P. Vejdělková of the physico-chemical department of this institute for registration and interpretation of IR, UV and NMR spectra. The mass spectrum was recorded by Dr M. Ryska, Institute of Macromolecular Chemistry, Czechoslovak Academy of Sciences, Prague. Technical cooperation with the preparative part of the work by Mrs M. Šebestiková is acknowledged. The analyses were done at the analytical department of this institute by Mr M. Čech, Mr K. Havel, Mrs V. Šmidová, Mrs J. Komancová, Mrs J. Hrdá, Mrs A. Slavíková and Mrs Z. Volková.
