

the antioxidants, indirectly with a chapter on carotenoids. The importance of such analyses can be seen with the new development of transgenic tomatoes with improved antioxidant and rheological properties as the first transgenic products to go to market. The assessment of the quality of such products requires these analyses during its development. At a time when transgenic plants are adding to the crop resource, it is timely that this series of methodology books

is being developed. Not only will the analysis of plant products derived by breeding technology continue to require to be monitored by such analyses, these will also be required by the genetic engineer to assess the products of their technology. Such books on basic analytical techniques will always have their place.
