

FOOD CHEMISTRY

The chemical and biochemical composition of foods is fundamental to the study of their properties and processing applications. *Food Chemistry* publishes original peer-viewed research papers dealing with a wide range of subjects which are essential to the food scientist and technologist.

Topics include:

- the chemical analysis of food;
chemical additives and toxins;
- chemistry relating to the microbiological, sensory, nutritional and physiological aspects of food;
- structural changes in molecules during the processing and storage of foods;
- direct effects on foods of the use of agrochemicals;
- chemical quality in food engineering and technology.

Additionally the journal features analytical papers concerned with micronutrients, macronutrients and other chemical constituents of foods, including contaminants. The journal contains a discrete analytical section for papers whose main ethos is methodological and such papers should be concerned with methods, their development and evaluation and results of collaborative trials. Nutritional, physiological and clinical methods will be considered if they relate to dietary chemistry. All papers for the journal will be concerned with chemical aspects of food at any point in the food chain.
