

Foreword

## New developments in guaranteeing the optimal sensory quality of meat

The variability in meat quality is a major problem within the meat industry. Despite much work that is done to understand the scientific basis of sensory perceived quality attributes, their evaluation, prediction and control remain mostly elusive within the meat processing plant, especially within 48 h post-slaughter. Therefore, novel physical and chemical indicators of quality are needed to develop rapid methods for the meat industry to evaluate accurately and control the quality parameters of its products. To address these issues, a 2-day Symposium on the topic above was organised within the framework of the project FAIR3 CT96 1107 entitled *The prediction of meat quality at the early postmortem period by detection of novel physical and chemical markers*, supported by the European Commission. The main objectives of the project were to transfer more advanced technologies and stimulate their application in meat production, especially in small and medium size European meat industries.

The organisers wish to acknowledge the financial support of the European Commission (FAIR CT98-4829), Vaquero Foundation for R&D on Pork Meat, CSIC, the Ayuntamiento (City Hall) of Madrid, the Comisión Asesora de Ciencia y Tecnología (CICYT: ALI98-1813-E) and the collaboration of the Liaison Centre for the Meat Processing Industry in the EU (CLITRAVI), the Spanish Association of Meat Industries (AICE), Asocarne, FECIC, and Instituto de Salud Carlos III. Ms Aurora Sánchez from the Vaquero

Foundation and the staff of the Laboratory of Meat Science (Department of Food Science), especially Ms M. Angeles García, from the Instituto de Agroquímica y Tecnología de Alimentos (CSIC) in Valencia have been essential in the organisation of this Symposium. The organisers would like to thank Mr Liam Breslin and Mr Xabier Goenaga (Research DG) for their valuable collaboration as well as all those who have contributed to this event, especially the lecturers, chairpersons and participants. The invited lectures are reproduced in this special issue thanks to the Editor of *Food Chemistry*, Dr Jacques P. Roozen who has been so kind to arrange all of them together. This special issue presents the latest developments for the application of new technologies based on (bio)-chemical and physical markers for the prediction of sensory quality at early postmortem stages, a new area in the field of meat research.

Organisers of the Symposium and Guest Editors:

Fidel Toldrá  
*Department of Food Science, Instituto de Agroquímica y  
Tecnología de Alimentos (CSIC), Apartado 73,  
46100 Burjassot (Valencia) Spain
