#### Abstract

Zusammenfassung. Eine thermische (a) und cine reduktive (b) Mcthode zur Herstellung von Mikanez-Estern wird beschrieben. Bei der ersten gelang der Nachweis des monomeren Vorläufers, 1,3-Butadien-2-carboxylester, (a) trans/cis-Gemische von Methyl resp. Xthyl 2-Brom-1-mcthylcyclopropancarboxylat (14/15 resp. 16/17), mit Tri-n-butylzinnhydrid aus den entsprechenden 2,2-Dibrom-1-methylcyclopropancarboxylaten 12 resp. 13 hergestellt, wurden bei $480^{\circ} / 1,7$ Torr pyrolysiert. Die bei $-78^{\circ}$ daraus abgefangenen Kondensate bestanden aus den 1,3-Butadien-2-carboxylaten 5 und 6 . im Falle des Athylesters 6 durch seine 1 H -NMR.-Signale charakterisiert und als Addukt (19) mit 4-Phenyl-1, 2,4-triazolin-3,5-dion (18) abgefangen (55\%). Beim Erwärmen der Kondensate dimerisierten die Dienester 5 resp. 6, so dass sich Dimethyl resp. Diäthyl Mikanezat ( 9 resp. 10) isolieren liess ( 67 resp. $100 \%$ ). (b) Behandlung von Methyl 2(E)-2-Methyl-2-butenoat (20) mit 2 Äquivalenten N-Bromsuccinimid gab (25\%) Methyl 2(Z)-4-Brom-2-brommethyl-2-butenoat (21). (Mit 3 Aquivalenten entstand ein Stereomerengemisch $2(Z)$ - und 2(E)-4,4-Dibrom-2-brommethyl-2-butenoat ( 22 und 23)). Reduktion des Dibromesters 21 mit Zink in 'letrahydrofuran, Methanol oder Eisessig ergab ( $50 \%$ ) Dimethyl Mikanczat (9). Von einer Iodolaktonisierung der aus 9 durch Verseifung hergestellten Mikanezsà̉ure (8) erhielt man 4-Lodo-7-oxo-1-vinyl-6-oxabicyclo[3.2.1]octan-4endocarbonsäure (24), desson Bildungsleichtigkeit und IR.-Bande bei 1780 cm einc unabhängige Bestätigung dafür liefert, dass Mikanezsäure (8) durch Kopf-zu-Kopf-Diels-Aldef-Dimerisierung von 1,3-Butadien-2-carbonsäure (4) entsteht.

Aus Methyl (E)-2-Methyl-2-pentenoat (25) wurde auf gleiche Weise, d.h. uber Dibromierung zu 27 und Reduktion mit Zink in Ather, Dimethyl 3, 2'-Dimethylnikanezat (29) gewonnen. Die Multiplizität des ${ }^{1} \mathrm{H}-\mathrm{NM}$.-Signals von $\mathrm{H}-\mathrm{C}(3)$ in 29 bestätigt, wiedcrum unabhängig, dass die Dimerisierung des Diencsters (in diesem Fall 28) in Kopf-zu-Kopf-Diels-Alder-Weise stattfindet.

1. Introduction. - Mikanecic acid, $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{4}$, m.p. $239^{\circ}$, has an interesting history which is not well known. First isolated in 1901 [ $\mathbf{1 ]}$ from alkali treatment of ethyl 2-methyl-3,3-di-(phenylsulfonyl)-butanoate [1], it has also been obtained from the pyrolysis of methyl 2-acetoxy-2-methyl-3-butenoate [2], from the nickel-carbonyl carbonylation of vinyl acetylene [3], from the thermal reaction of formaldehyde with

[^0]allyl-cyanide 14 ] and with crotonaldchyde [5], from the dimerization of cyanoprene [6] and from the alkaloids mikanoidine (hence the name) [7] [8] and sarracine [.9]. Among the structures which have been proposed are $1[1], 2[3]$ and $3[8]$.

1

2

3

The derivation of mikanecic acid suggested it to be a dimer of 1,3-butadiene-2carboxylic acid ( $4=$ isoprenoic acid) and degradation [3b] [4] [6] eventually estab-

$$

$6,10: R=C_{2} H_{5}$
lished one of the two Diels-Alder dimerization structures, namely 8, as first proposed by Marvel [6] and accepted by others [2] [3b] [9] [10]. Structure 8 represents a head-to-head isoprenc assembly, whereas the alternative Diels-Alder dimer 7 would have been a head-to-tail assembly. The monomer, isoprenoic acid $\langle 4$ ), and its esters have so far not been isolated.

The structure 8 of mikanccic acid as a 1.,4,4-trisubstituted cyclohexene (rather than $1,5,5$-substituted, 7 ) is pertinent to the regiospecificity problem in the DielsAlder reaction of substituted butadienes. This, along with experimental evidence in other cases [11], has led to the generalization that Diels-Alder reactions between 1- or 2-substituted butadienes and polar dienophiles usually produce 3,4- or 1,4- (rather than 3,5 - or $1,5-$ ) substituted cyclohexenes, respectively, and that this regiospecificity ${ }^{5}$ ) is independent of the electron-accepting or releasing nature of the butadiene substituent. The effect has also been theoretically rationalized [12] [13].

We had previously encountered the methyl ester of mikanecic acid (9) in our work on the NBS-bromination of 2-methyl-2-butenoic (tiglic and angelic) esters [14] as a

[^1]minor product ${ }^{6}$ ) of unexplained ${ }^{7}$ ) origin. This background [14] and our previous observations [15] on the ring opening of alkyl-dihalo-cyclopropanes lead us to new methods of preparation of esters of mikanecic acid as well as a dimethyl derivative and to the first direct observation as well as the capture of the precursor, 1,3-buta-diene-2-carboxylic (isoprenoic) ester. Two methods will be reported here, a thermal and a reductive one.
2. Thermal route: wia methyl and ethyl 2-bromo-1-methylcyclopropanecarboxylates. - The previously known [16] methyl (12) and ethyl (13) 2,2-dibromo-1-methylcyclopropanecarboxylate were prepared by an improved [17] method (in the methyl ester case the corresponding 2,2-dibromo-1-methylcyclopropanecarboxylic acid (11) was also obtaincd) and reduced with tributyltin hydride [18]

11, 12, 13
11: $\mathrm{R}=\mathrm{H}$; $\quad 12,14,15: \mathrm{R}=\mathrm{CH}_{3}$;

14, 15, 16, 17
$13,16,17: R=C_{2} H_{5}$
to mixtures ( $6: 4$ and 7:3 respectively) of two stereoisomers (thans and cis) each of methyl ( 14 and 15) and cthyl (16 and 17) 2-bromo-1-methylcyclopropanecarboxylate. The two stereoisomers were not separated in both cases, but configurations could be assigned with the help of the separately visible signals in the ${ }^{1} \mathrm{H}$-NMR.-spectra, on the assumption that vicinal protons or protons of a vicinal substituent cis to a bromine atom or to an alkoxycarbonyl group absorb at a lower field than the same trans to such groups, as follows:

14, 16 : trans
upper figures: $\mathrm{R}=\mathrm{CH}_{3}(\mathbf{1 4 , 1 5 )}$;

15, 17 : cls
lower figures : $\mathrm{R}=\mathrm{C}_{2} \mathrm{H}_{5}(\mathbf{1 6 , 1 7 )}$

[^2]Both stereoisomer mixtures of the monobromo esters $14 / 15$ and $16 / 17$ respectively were pyrolyzed by passing them at 1.7 Torr through a pyrex tube at $480^{\circ}$. When the pyrolyzates, collected at $-78^{\circ}$, were allowed to warm to room temperature $67 \%$ and $100 \%$ of dimethyl (9) and diethyl (10) esters of mikanecic acid, respectively, were isolated. This reaction probably proceeds by thermal elimination of hydrogen bromide under opening of the ring bond ( $\mathrm{C}(1)-\mathrm{C}(3)$ ) vis a vis the bromine-carrying carbon atom to give the esters of 1,3 -butadiene-2-carboxylic acid 5 and 6 , which then dimerise to the esters of mikanccic acid 9 and 10 respectively. The high yields of 9 and especially 10 indicate that both the trans- (14/16) and the cis-bromoesters (15/17)

14/15, 16/17
undergo the thermal eliminative ring opening. The mechanism of the reaction is under investigation.

The dimerization occurs only on warming, for a solution of the cold pyrolyzate from the ethyl ester $16 / 17$ in $\mathrm{CDCl}_{3}$ showed $1 \mathrm{H}-\mathrm{NMR}$.-signals attributable to ethyl 1,3-butadiene-2-carboxylate (6) as follows:

It was also possible to capture the diene ester 6 by allowing it to enter a DielsAlder reaction with 4-phenyl-1,2,4-triazoline-3,5-dionc (18) [19]. This cycloaddition evidently competes favorably with the above mentioncd dimerization of 6 . The product (m.p. $139^{\circ}, 55 \%$ yield) was shown to be a $1: 1$ adduct with structure 19 by the mass- ( $m / e 301 / 100 \%$ ), the IR.- (bands at 1775, 1720, 1660 and $1595 \mathrm{~cm}^{-1}$ ) and the ${ }^{1} \mathrm{H}-\mathrm{NMR}$.-spectra (multiplets at $\delta=7.5,7.12$ and 4.38 in the ratio of $5: 1: 4$, along with the well known cthoxy signals). These results represent the first direct observation of an ester of isoprenoic acid.

## 3. Reductive route: via methyl 4-bromo-2-bromomethyl-2-butenoate.

 We had previously reported [14] that methyl 2(E)-2-methyl-2-butenoate (20) undergoes a rapid ( 1 h ) monobromination with N -bromosuccinimide to give a
mixture of two constitutionally isomeric monobromo esters [14] and that the introduction of a second bromine atom to give the dibromo ester 21 proceeds much more slowly. Under still more energetic conditions ( 20 h ) the tribromo-ester can be obtained as a 3:1 mixture of two stercomers, 22/23.

22

23

The constitution of the dibromo-ester, which appears as a single stereoisomer, as the product of bromination of both methyl groups (21) follows from the $\mathbf{1 H}-\mathrm{NMR}$.signals at $7.00 / t(J=8.5), 4.21 / \mathrm{s}, 4.08 / d(J=8.5)$ and $3.80 / \mathrm{s}$ in the ratios of $1: 2: 2: 3$, and its $2(Z)$-configuration is made likely by the low field absorption of the vinylic hydrogen atom ( $\mathrm{H}-\mathrm{C}(3)$, cis to $\mathrm{COOCH}_{3}$ ) [14], with the reservation that the other stereoisomer was not available for comparison. The constitution of the two isomeric tribromo-esters as methyl $2(Z+E)$-4,4-dibromo-2-bronomethyl-2-butenoates (22 and 23) was deduced from the ${ }^{1} \mathrm{H}-\mathrm{NMR}$.-signals in the mixture, nam ly $\delta=7.19$ and $7.21 /$ both $d(J=\sim 11), 6.42$ and $6.70 /$ the first $d(J=11)$, the second $d \times t(J=\sim 11$ and 1$), 4.16$ and $4.10 /$ the first $s$, the second $d(J=1), 3.85 / s$ in the ratios of $1: 1: 2: 3$ and cvery pair in the ratio of $3: 1$. The $2(Z)$-configuration (22) may be assigned to the major isomer, if it is assumed that the desticicling of $\mathrm{H}-\mathrm{C}(4)$ in $23(8=6.70)$ as compared to $22(\delta=6.42)$ is due to the cis-location of $\mathrm{COOCH}_{9}$ in 23 . Here it must be noted, that the vinyl hydrogen atoms $\mathrm{H}-\mathrm{C}(3)$ are deshiclded to the same extent ( $\delta=7.19$ and 7.21 ) in both stereoisomers 22 and 23 (with $\mathrm{H}-\mathrm{C}(3)$ trans and cis to $\mathrm{COOCH}_{3}$, compare [14]); this may be due to a dominating deshielding of $\mathrm{H}-\mathrm{C}(3)$ by the two vicinal bromine atoms $\left(\mathrm{Br}_{2}-\mathrm{C}(4)\right)$ which must bs located $\operatorname{syn}$ to $\mathrm{H}-\mathrm{C}(3)$ since the coupling of 11 Hz between $\mathrm{H} \cdot \mathrm{C}(3)$ and $\mathrm{H}-\mathrm{C}(4)$ shows these hydrogen atoms to be in an anti-conformation in both stereoisomers.

The optimum conditions of dibromination of 20 avoiding as much as possible mono- and tri-bromination, namely 2.2 mol equivalents N -bromosuccinimide, 7 h reflux over a lamp, gave a $25 \%$ yield of methyl $2(Z)$-4-bromo- 2 -bromomethyl-2-
butenoate (21). When this dibromo-cster 21 was treated with zinc powder in tetrahydrofuran ${ }^{8}$ ), in methanol or in acetic acid the dimethyl ester of mikanecic acid (9)

was obtained in about $50 \%$ yield. Evidently, reductive debromination (as shown) converts 21 to methyl 1,3-butadiene-2-carboxylate (5), which dimerizes to 9 in situ . A careful analysis of the ${ }^{1} \mathrm{H}-\mathrm{NMR}$.-spectrum of 9 is given below.

9
The dimethyl ester (9) was saponified to mikanecic acid (8), m.p. $240^{\circ}$, and the latter reesterified to 9 with diazomethanc. Treatment of mikanecic acid (8) with iodine and aqueous sodium hydrogen carbonate resulted in iodolactonization to give ( $69 \%$ ) 4-iodo-7-oxo-1-vinyl-6-oxabicyclo[3.2.1] octane-4-endo-carboxylic acid (24), m.p $174^{\circ}$. Several signals of its ${ }^{1} \mathrm{H}$-NMR.-spectrum can be interpreted to support structure 24 as follows:

## 24

[^3]The mode of formation and the IR.-band at $1780 \mathrm{~cm}^{-1}$ confirm that 24 is a $\gamma$-lactone. Its ease of formation suggests that lactonization took place at the olefinic carbon atom $\beta$ - (and not $\alpha$-) to the carboxylic acid. This offers independent confirmation that mikanecic acid has structure 8 (and not 7) and that, therefore, the dimerization of isoprenoic acid (4) is of the head-to-head Diels-Alder type.
4. Dimethyl ester of 3,2 -dimethylmikanecic acid. - The dibromination plus zinc debromination sequence was also applied to the synthesis of a dimethyl derivative of an ester of mikanecic acid. Treatment of methyl $2(E)$-2-methyl-2-pentenoate (25) with 1.1 and with 2.5 mol equivalents N -bromosuccinimide for $2 \frac{1}{2}$ and for 16 h , respectively, gave a single stercoisomer in each casc, namely methyl $2(E)$-4-

25

26

27
bromo-2-methyl-2-pentenoate (26, 75\%) and methyl 2(Z)-4-bromo-2-bromomethyl-2-pentenoate (27, 46\%), respectively. The ${ }^{1} \mathrm{H}$-NMR.-signals shown on the formulae 26 and 27 clearly confirm the constitutions and probably (chemical shifts of $\mathrm{H}-\mathrm{C}(3)$, see above) also the configurations given. Evidently the $\mathrm{C}-\mathrm{C}-\mathrm{CH}_{\mathrm{g}}$-group of the 2 -methyl-2-pentenoate system (25) is more susceptible to NBS-bromination than the $\mathrm{C}=\mathrm{C}-\mathrm{CH}_{3}$-group; for the monobromination product contains only the 4-bromo-isomer 26, whereas the previously described [14] bromination of the 2-methyl-2-butenoate system produced the 4-bromo- and the 2-bromomethyl-isomers in a 2:1 ratio.

Reduction of the dibromo-ester 27 with granulated zinc in ether afforded $48 \%$ of dimethyl 3-methyl-4-(prop-( $E$ )-enyl)-cyclohex-1-ene-1.,4-dicarboxylate (29), presumably via dimerization of methyl 1,3 -pentadiene-2-carboxylate (28).

The ${ }^{1} \mathrm{H}$-NMR.-spectrum of the dimer confirms structure 29 as follows:

29

The absence of additional coupling in the signal due to $\mathrm{H}-\mathrm{C}(3)(\delta=2.95)$ beyond the one with the methyl protons $(J=7)$ and the one with the vinyl proton $(J=4.6)$, both confirmed by decoupling, shows that $\mathrm{C}(4)$ is fully substituted and thus establishes that the dimerization in this case was also of the head-to-hcad Diels-Alder type, as in the formation of the esters of mikanecic acid 9 and 10.

This work was supported in part by the Schweizerischer Nationalfonds zur Förderung der wissenschaftlichen Forschung and by Sandoz AG, Bascl. We thank Messrs. II. Hilpert, R. Martin and $H$. P. Rüesch for their technical assistance.

## Experimental Part

1. General. - Symbols, abbreviations and other indications used here have been describecl in [21] apart from the following modifications or additions: The IR.-spectra were measured on a Perkin-Elmer 21, 421 or 457 IR.-spectrometer. The mass spectra were measured on a CEC 21-110B, Atlas CH-5 or AEI MS 902 instrument and only selected peaks are reported. The 1H-NMR.-spectra were measured with either a Varian A-60A or Varian HA-100 instrument with relative integration in H units.
2. Thermal route to dimethyl 4-vinyl-cyclohex-1-ene-1,4-dicarboxylate (9). 2.1. Methyl 2,2-dibromo-1-methylcyclopropanecarboxylate (12). Reaction similar to [16] between $50 \mathrm{~g}(500 \mathrm{mmol})$ of methyl methacrylate and $150 \mathrm{~g}(600 \mathrm{mmol})$ of bromoform, but using 1.5 g of triethylbenzylammonium chloride [17] and 95 ml of $50 \%$ aqueous sodium hydroxide yielded $53.5 \mathrm{~g}(39 \%)$ of methyl 2,2-dibromo-melhylcyclopropanecarboxylate (12), b.p. $49^{\circ} / 0.23$ Torr, $\mathrm{n}_{\mathrm{D}}^{24}$ 1.5170 (Lit. [16] b.p. $106-109^{\circ} / 25$ Torr, $\mathrm{n}_{\mathrm{D}}^{25} 1.5173$ ) and 55 g ( $42 \%$ ) of 2,2-dibromo-1-methylcyclopropanecarboxylic ucid (11), m.p. $109^{\circ}$ (Lit. [66] m.p. $11.0^{112.5^{\circ}}$ ). - The TR.- and ${ }^{1} \mathrm{H}$-NMR.spectra of the ester 12 and acid 11 are in agreement with those reported in [16].
2.2. Ethyl 2,2-dibromo-7-methylcyclopropanecarboxylate (13). The reaction described above was repeated using $114 \mathrm{~g}(1000 \mathrm{mmol})$ of ethyl methacrylate, $300 \mathrm{~g}(1200 \mathrm{mmol})$ of bromoform, 3.0 g of triethylbenzylammonium chloride [ 16,17$]$ and 1.90 ml of $50 \%$ aqucous sodium hydroxide to give $224 \mathrm{~g}(78 \%)$ of ethyl 2,2-dibromo-7-methylcyclopropanscarboxylate (13), b.p. $66^{\circ} / 0.16$ Torr,
 $685 \mathrm{~m} . \mathrm{T}^{1} \mathrm{H}-\mathrm{NMR} .\left(60 \mathrm{MHz}, \mathrm{CCl}_{4}\right): 4.20 / \mathrm{q}(J=7), 2 \mathrm{H}\left(\mathrm{CH}_{2}\right.$ of ethoxy); $2.36 / d(J=7.5), 1 \mathrm{HI}$ $(\mathrm{H}-\mathrm{C}(3)) ; 1.57 / s, 3 \mathrm{H}\left(\mathrm{CH}_{3}-\mathrm{C}(1)\right) ; 1.50 / d(J=7.5), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(3)) ; 1.31 / t(J=7), 3 \mathrm{H}\left(\mathrm{CH}_{\mathrm{s}}\right.$ of ethoxy).

2.5. Pyrolysis of methyl 2-bromo-1-methylcyclopropanecarboxylales 14 and $15.0 .27 \mathrm{~g}(1.4 \mathrm{mmol})$ of methyl 2 -bromo-1-methylcyclopropanecarboxylate 14 and $\mathbf{1 5}$ was passed through a pyrex tube ( 18 cm long, 0.8 cm diameter) packed with 0.1 g of pyrex wool and sodium carbonate and maintained at $482^{\circ} 1.7$ Torr. The product was collected at $-78^{\circ}$ in a flask containing some sodium carbonate. After warming to room temperature 0.18 g ( $67 \%$ ) dimethyl 4-vinyl-cyclohex-1-ene-7,4dicarboxylate (9) was isolatecl. It was identical by mass-, IR.-, and 1 H -NMR.-spectra with the compound described in 3.3 and was pure to the extent of $>90 \%$.
2.6. Pyrolysis of ethyl 2-bromo-7-methyl-cyclopropanecarboxylates 16 and $17.2 .0 \mathrm{~g}(9.7 \mathrm{mmol})$ of ethyl 2-bromo-1-methyl-cyclopropanecarboxylate 16 and $\mathbf{1 7}$ was pyrolysed at $480^{\circ} / 1.7$ Torr in cssentially the same way as described above for the methyl derivatives ( $\mathbf{1 4}$ and $\mathbf{1 5}$ ). Isolation of the product after warming to room temperature gave $1,2 \mathrm{~g}(100 \%)$ of diethyl 4-vinyl-cyclohex-1-ene-1,4-dicarboxylate (10). - IR. $\left(\mathrm{CCl}_{4}\right): 1775 w ; 1732 \mathrm{~s}(\mathrm{O}-\mathrm{C}-(4)) ; 1720 \mathrm{~s}(\mathrm{O}=\mathrm{C}-\mathrm{C}(1)) ; 1655$ w; $1255 \mathrm{~s} ; 1080 \mathrm{~m}$; $990 w ; 918 w ; 908 w .-{ }^{1} \mathrm{H}-\mathrm{NMR} .\left(60 \mathrm{MHz}, \mathrm{CCl}_{4}\right): 6.84 / m, 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(2)) ; 6.20-$ $5.85 / m, 3 \mathrm{H}\left(\mathrm{H}-\mathrm{C}\left(1^{\prime}\right), 2 \mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right) ; 4.13 / 2 \times q(J=7) .4 \mathrm{H}\left(2 \mathrm{CH}_{2}\right.$ of 2 ethoxy $) ; 3.10-1.60 / m$, $6 \mathrm{H}(2 \mathrm{II}-\mathrm{C}(3), 2 \mathrm{H}-\mathrm{C}(5), 2 \mathrm{H}-\mathrm{C}(6)) ; 1.27 / t(J=7), 3 \mathrm{H}\left(\mathrm{CH}_{3}\right.$ of ethoxy $) ; 1.23 / t(J=7), 3 \mathrm{H}$ $\left(\mathrm{CH}_{3}\right.$ of cthoxy). - MS. (70 cV) : $252\left(5.1, M^{+}\right)$.
2.7. Ethyl 1,3-butadiene-2-carboxylate (6, ethyl isoprenoate) and its 4-phenyl-1,2,4-triazoline-3,5-dione adduct (19). The thermolysis of ethyl 2-bromo-1-methylcyclopropanccarboxylate ( $\mathbf{1 6}$ and 17) was performed as described in the prececding experiment. The material in the cold trap, diluted with some $\mathrm{CDCl}_{3}$ and allowed to warm to $-60^{\circ}$ only, showed the following ${ }^{1} \mathrm{H}-\mathrm{NMR}$.signals, next to those of unreacted starting material ( $\mathbf{1 6}$ and 17) ( $\mathbf{5 5 \%} \%$ ): ${ }^{1} \mathrm{H}-\mathrm{NMR}$. ( 100 MHz , $\left.\mathrm{CDCl}_{3}\right): 6.32 / q=X$ part of an $A B X$ system, $1 \mathrm{H}(\mathrm{H}-\mathrm{C}(3) ; 5.92 / \mathrm{br} . \mathrm{s}, 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(1)) ; 5.62 / \mathrm{br} . \mathrm{s}$, $1 \mathrm{H}(\mathrm{H}-\mathrm{C}(1)) ; 5.50-4.95 / m=A B$ part of $A B X$ system, $2 \mathrm{H}(2 \mathrm{H}-\mathrm{C}(4 j) ; 4.05 / q(J=7), 21 \mathrm{I}$ ( $\mathrm{CII}_{2}$ of ethoxy) ; $1.27 / t(J=-7), 3 \mathrm{H}\left(\mathrm{CH}_{3}\right.$ of ethoxy). These signals are considered to belong to ethyl 7,3-butadiene-2-carboxylate (6). After this solution had been permitted to stand at room temperature for 12 h , the signals in the 4.956 .80 region tue to 6 lad disappeared while those of the dimer $\mathbf{1 0}$ had appeared.

The thermolysis of $0.69 \mathrm{~g}(3,3 \mathrm{mmol})$ of the $\mathbf{1 6} / \mathbf{1 7}$ mixture was repeated but this time the product was diluted with methylene chloride at $-78^{\circ}$ and a solution of 4 -phenyl-1, 2,4-triazoline-

3,5-dione (18) [19] in methylene chloride was added at this temperature until the red colour persisted. Evaporation of the solvent gave an oily residue which was purified by column chromatography over silica gel using benzene/acetone $8: 1$. Recrystallization from hexane/acetone $7: 1$ gave $0.55 \mathrm{~g}(55 \%)$ of 3-ethoxycarbonyl-8-phenyl-1, 6, 8-triaza-bicyclo[4.3.0]non-3-ene-7,9-dione (19), m.p. $139^{\circ}$. - IR. (KBr) : $1775 \mathrm{~m} ; 1720 \mathrm{~s}(\mathrm{C}=\mathrm{O}) ; 1660 w(\mathrm{C}=\mathrm{C}) ; 1595 w ; 1495 \mathrm{~m} ; 1420 \mathrm{~s} ; 1310 \mathrm{~m}$; $1270 \mathrm{~s} ; 1245 \mathrm{~s} ; 1125 \mathrm{~s} ; 760 \mathrm{~m} ; 720 \mathrm{~m} . \mathbf{- 1}^{1} \mathrm{H}-\mathrm{NMR} .\left(100 \mathrm{MHz}, \mathrm{CDCl}_{\mathrm{s}}\right.$ ) : 7.5/m,5 H (aromatic H's); $7.12 / m, 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(4)) ; 4.38 / m, 4 \mathrm{H}(2 \mathrm{H}-\mathrm{C}(2), 2 \mathrm{H}-\mathrm{C}(5)) ; 4.31 / q(J=7), 2 \mathrm{H}\left(\mathrm{CH}_{2}\right.$ of ethoxy); $1.35 / t(J=7), 3 \mathrm{H}\left(\mathrm{CH}_{3}\right.$ of ethoxy). - MS. $(70 \mathrm{eV}): 301\left(100, M^{+}\right)$.

$$
\mathrm{C}_{15} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}_{4}(301.306) \quad \text { Calc. C } 59.80 \quad \mathrm{H} \mathrm{5.02} \mathrm{\%} \quad \text { Found C } 59.99 \quad \mathrm{H} 4.90 \%
$$

The residue from the crystallization mother liquor was shown to contain $\sim 10 \%$ yield of the dimer 10 as well as starting material 16 and 17.

When the thermolysis of the $16 / 17$ mixture was carried out at $450^{\circ} / 0.1$ Torr and the distillate treated with 18, the product consisted of $65 \%$ of starting material 16 and $17,30 \%$ of the triazolinedione adduct 19 and $5 \%$ of the dimer 10.
3. Reductive route, - 3.1. Methyl $2(Z)$-4-bromo-2-bromomethyl-2-butenoate (21). A solution of $24.5 \mathrm{~g}(215 \mathrm{mmol})$ of methyl $2(E)-2$-methyl-2-butenoate ( 20 ) and $85.44 \mathrm{~g}(480 \mathrm{mmol})$ of N -bromosuccinimide in 200 ml of dry, redistilled carbon tetrachloride was refluxed over a 150 W bulb for 7 h . The reaction mixture was cooled, the succinimide filtered off and the carbon tetrachloride removed under reduced pressure to give 38.08 g of a yellow oil, shown by TLC. to consist of three species. The mixture was fractionally distilled under vacuum. The first fraction, b.p. 45-68\% 0.04 Torr, consisted of $6.25 \mathrm{~g}(16 \%)$ of a mixture of the monobromo esters, methyl 2 ( E )-4-byo-mo-2-methyl-2-butenoate and methyl $2(\mathrm{E})$-2-bromomethyl-2-butenoate, the properties of which have been described earlier [14]. After discarding a second fraction of 1.40 g containing a complex mixture of bromo compounds, b.p. $68-77^{\circ} / 0.04$ Torr, $19: 08 \mathrm{~g}$ of a yellow oil b. p. $77-81^{\circ} / 0.04$ Torr was collected. This last fraction was refractionated to give 15.23 g of product b. p. $80-81 \%$. 0.07 Torr. After filtering off a small amount of polymeric material the oil was redistilled using a short-path distillation technique to give $14.80 \mathrm{~g}(25 \%)$ of methyl $2(\mathrm{Z})$-4-bromo-2-bromomethyl-2-butenoate (21) as a pale yellow oil, b. p. $80^{\circ} / 0.07$ Torr. - IR. (Film) : $1725 \mathrm{~s}(\mathrm{C}=\mathrm{O}) ; 1650 \mathrm{~m}(\mathrm{C}=\mathrm{C}) ; 1290 \mathrm{~s} ; 1205 \mathrm{~s}$; 1175 m ; $1050 w ; 965 w ; 775 \mathrm{~m}$; 758 w. - ${ }^{1} \mathrm{H}-\mathrm{NMR}$. ( $60 \mathrm{MHz}, \mathrm{CCL}_{4}$ ): $7.00 / t(J=8.5$ ), $1 \mathrm{H}(\mathrm{H}-\mathrm{C}$ (3)); $4.21 / \mathrm{s}, 2 \mathrm{H}\left(2 \mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right) ; 4.08 / d(J=8.5), 2 \mathrm{H}(2 \mathrm{H}-\mathrm{C}(4)) ; 3.80 / \mathrm{s}, 3 \mathrm{H}\left(\mathrm{CH}_{3} \mathrm{O}\right)$.
3.2. Methyl $2(\mathrm{Z})$ - and 2(E)-4,4-dibromo-2-bromomethyl-2-butenoate (22 and 23). When a solution of 24.5 g ( 215 mmol ) of methyl $2(E)$-2-methyl-2-butenoate ( 20 ) and $85.44 \mathrm{~g}(480 \mathrm{mmol})$ of N -bromosuccinimide in 200 ml of dry, redistilled carbon tetrachloride was refluxed over a 150 W bulb for 20 h two additional products were obtained from the fractional distillation. After collecting 29.50 g of a mixture of mono- and dibromo-esters (see 3.2 above), 6.31 g of a yellow oil distilled, b. p. 105-115\% 0.03 Torr. Redistillation under vacuum using a short path distillation technique gave $4.96 \mathrm{~g}(7 \%)$ of a pale yellow oil, b. p. $113^{\circ} / 0.03$ Torr, consisting, according to the ${ }^{1} \mathrm{H}$-NMR.spectrum (see below), of a 3:1 mixture of methyl 2(Z)-4,4-dibromo-2-bromomethyl-2-butenoate (22) and methyl $2(\mathrm{E})-4$, 4-dibromo-2-bromomethyl-2-butenoate (23). - IR. (Film) : $1725 \mathrm{~s}(\mathrm{C}=\mathrm{O}) ; 1635$ w $(\mathrm{C}=\mathrm{C}) ; 1595 w(\mathrm{C}=\mathrm{C}) ; 1285 \mathrm{~s} ; 1225 \mathrm{~m} ; 1205 \mathrm{~m} ; 1160 \mathrm{~m} ; 1050 w ; 960 w ; 910 w ; 835 w ; 776 \mathrm{~m} .-$ The ${ }^{1} \mathrm{H}$-NMR.-spectrum of the mixture is described as if the two isomers were observed separately as follows: ${ }^{1} \mathrm{H}-\mathrm{NMR}$. of $22\left(60 \mathrm{MHz}, \mathrm{CCl}_{4}\right): 7.19 / d(J=11), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(3)) ; 6.42 / d(J=11), 1 \mathrm{H}$ ( $\mathrm{H}-\mathrm{C}(4)) ; 4.16 / \mathrm{s}, 2 \mathrm{H}\left(2 \mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right) ; 3.85 / \mathrm{s}, 3 \mathrm{H}\left(-\mathrm{OCH}_{3}\right) .{ }^{-1} \mathrm{H}-\mathrm{NMR}$. of $23\left(60 \mathrm{MHz}, \mathrm{CCl}_{4}\right): 7.21 / d$ $(J=10.5), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(3)) ; 6.70 / d \times t(J=10.5$ and 1$), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(4)) ; 4.10 / d(J=1), 2 \mathrm{H}(2 \mathrm{H}-\mathrm{C}$ $\left.\left(1^{\prime}\right)\right) ; 3.85 / s, 3 \mathrm{H}\left(\mathrm{CH}_{8} \mathrm{O}\right)$.
3.3. Dimethyl 4-vinyl-cyclohex-7-ene-7, 4-dicarboxylate (9, dimethyl ester of mikanecic acid). 3.3.1. Under Reformatsky reaction conditions. A solution of 3.2 g ( 12 mmol ) of methyl 2(Z)-4-bro-mo-2-bromomethyl-2-butenoate (21) and 10.57 g ( 96 mmol ) of 3-methylcyclohex-2-enone in 40 ml of tetrahydrofuran was heated under nitrogen at $90^{\circ}$ for 16 h with $1.0 \mathrm{~g}(15 \mathrm{mmol})$ of zinc powder. After filtering off the white solid formed the solution was poured into 200 ml water and extracted with $2 \times 50 \mathrm{ml}$ of ether. The ether extract was washed thoroughly with $5 \times 100 \mathrm{ml}$ of water, dried and evaporated to give 1.87 g of a pale yellow oil. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$.-spectrum of this crude product showed, in addition to the strong signals of the major product (see below), the following minor
signals: $6.17 / \mathrm{s} ; 5.98 / \mathrm{s}$ and $5.90 / \mathrm{s}$. Purification by column chromatography over 100 g of silica gel using ethyl acetate/pentane $1: 9$ separated 0.11 g of a less polar product (discarded) and 0.76 g of a colourless oil which was collected and distilled under vacuum to give dimethyl 4-vinyl-cyclohex-1-ene-1, 4-dicarboxylate (9) as a colourless liquid, b.p. $115-120^{\circ} / 0.05$ Torr, yield $0.62 \mathrm{~g}(47 \%)$. UV. $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right): 223(8200)$. - IR. $\left(\mathrm{CCl}_{4}\right): 1741 \mathrm{~s}(\mathrm{O}=\mathrm{C}-\mathrm{C}(4)) ; 1725 \mathrm{~s}(\mathrm{O}=\mathrm{C}-\mathrm{C}(1))$. -IR . (Film): 1740-1720/s, br. ( $2 \times$ ester $\mathrm{C}=\mathrm{O}$ ) ; $1660 \mathrm{~m}(\mathrm{C}=\mathrm{C}) ; 1640 w(\mathrm{C}=\mathrm{C}) ; 1260 \mathrm{~s} ; 1090 \mathrm{~s} ; 930 \mathrm{~m} ; 775 \mathrm{w}$; $750 w ; 720 \mathrm{~m} .{ }^{-1} \mathrm{H}-\mathrm{NMR}$. ( $100 \mathrm{MHz}, \mathrm{CCl}_{4}$ ) : $6.85 / \mathrm{m}$ with fine coupling $(J=2), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(2))$; $5.83 / d \times d(J=10$ and 16$), 1 \mathrm{H}\left(\mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right) ; 5.10 / d(J=10), 1 \mathrm{H}\left(\mathrm{H}(E)-\mathrm{C}\left(2^{\prime}\right)\right) ; 5.04 / d(J=16)$. $1 \mathrm{H}\left(\mathrm{H}(Z)-\mathrm{C}\left(2^{\prime}\right)\right) ; 3.64 / \mathrm{s}, 6 \mathrm{H}\left(2 \times \mathrm{OCH}_{3}\right.$, occasionally appearing as two very close singlets); $3.0-1.5 / m 6 \mathrm{H}(2 \mathrm{H}-(3), 2 \mathrm{H}-\mathrm{C}(5), 2 \mathrm{H}-\mathrm{C}(6))$. This spectrum is identical to that of the diester 9 obtained by esterification of the purified diacid 8 (see 3.4). - MS. ( 70 eV ): $224\left(16, M^{+}\right) ; 192(80)$; 165 (88); 133 (92); 105 (100); 91 (25); 77 (31); 59 (32).

The reaction did not proceed under the above conditions in the absence of 3 -methylcyclohex2 -enone. When the reaction was performed in benzene instead of tetrahydrofuran by refluxing for 18 h and working-up as described above, the diester 9 was obtained in a yield of only $10 \%$.
3.3.2. With sinc in methanol or acetic acid. A chilled solution of $1.00 \mathrm{~g}(4 \mathrm{mmol})$ of methyl 2(Z)-4-bromo-2-bromomethyl-2-butenoate (21) in 12 ml methyl alcohol or acetic acid was treated with $1.2 \mathrm{~g}(18.5 \mathrm{mmol})$ zinc powder and then stirred for 12 h at room temperature. After filtration it was diluted with 200 ml water and extracted with ether. The extracts were washed with aqueous sodium carbonate (not necessary when methyl alcohol was solvent) and water, dried and evaporated to leave 0.35 g of a pale yellow oil. Purification by preparative TLC. on silica gel with ethyl acetate/hexane $3: 17$ yielded $0.24 \mathrm{~g}(58 \%)$ of dimethyl 4-vinyl-cyclohex-7-ene-7,4-dicarboxylate (9). The ${ }^{1} \mathrm{H}$-NMR.-spectrum of this crude product was almost identical to the spectrum of the crude material described under 3.3.1 above.
3.4. 4-Vinyl-cyclohex-1-ene-1,4-dicarboxylic acid (8. mikanecic acid). A solution of 0.34 g ( 1.6 mmol ) of dimethyl 4-vinyl-cyclohex-1-ene-1,4-dicarboxylate (9) in 5 ml ethanol and 5 ml of $15 \%$ ( 18.8 mmol ) aqueous sodium hydroxide was refluxed for 2 h , cooled, diluted with 50 ml water and extracted with ether. The aqueous phase was acidified with $10 \%$ hydrochloric acid and extracted with ether. The combined extracts were washed with water, dried and evaporated to leave a pale yellow solid which was recrystallized from acetone to give $0.2 \mathrm{~g}(65 \%)$ of 4 -vinyl-cyclohex-1-ene-1,4-dicarboxylic acid (8) as colourless plates, m.p. 239-240 (Lit. [5] m. p. 238-239).UV. $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right): 225(7100)$. - IR. ( KBr ) : 3700-2300 s, br. $(\mathrm{OH}) ; 1700 \mathrm{~s}(\mathrm{COOH}) ; 1650 \mathrm{~m}(\mathrm{C}=\mathrm{C})$; $1290 \mathrm{~s} ; 950 \mathrm{~m} ; 930 \mathrm{~m} ; 770 \mathrm{w} ; 740 \mathrm{~m} ; 711 \mathrm{w} .{ }^{-1} \mathrm{H}-\mathrm{NMR} .\left(60 \mathrm{MHz}_{2} \mathrm{CD}_{3} \mathrm{COCD}_{3}\right): 7.03-6.86 / \mathrm{br} \mathrm{s}$, $1 \mathrm{H}(\mathrm{H}-\mathrm{C}(2)) ; 5.95 / d \times d(J=10$ and 18$), 1 \mathrm{H}\left(\mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right) ; 5.25 / d \times d(J=2$ and 10$), 1 \mathrm{H}(\mathrm{H}(E)-$ $\left.\mathrm{C}\left(2^{\prime}\right)\right) ; 5.05 / d \times d(J=2$ and 18$), 1 \mathrm{H}\left(\mathrm{H}(Z)-\mathrm{C}\left(2^{\prime}\right)\right) ; 3.2-1.5 / \mathrm{m}, 6 \mathrm{H}(2 \mathrm{H}-\mathrm{C}(3), 2 \mathrm{H}-\mathrm{C}(5), 2 \mathrm{H}-\mathrm{C}$ (6)).

A sample of the diacid 8, m.p. 239-240, was esterified with diazomethane to give the diester 9 whose ${ }^{1} \mathrm{H}$-NMR.-spectrum was identical to that described in 3.3.1.

When the reaction was repeated using 0.4 g of the crude diester 9 , obtained as described under $3.3 .1,0.224 \mathrm{~g}$ of the impure acid 8 was obtained. Recrystallization from acetone afforded 0.17 g 4-vinyl-cyclohex-1-ene-1,4-dicarboxylic acid (8), identical with the sample described above. The ${ }^{1} \mathrm{H}$-NMR.-spectrum of the residue from the crystallization mother liquor showed that it consisted mostly of the same diacid 8 ; however, two additional signals (less than $1 / 3 \mathrm{H}$ ) were present namely: $6.07 / \mathrm{s}, 5.63 / \mathrm{s}$.
3.5. Iodolactonization of 4-vinyl-cyclohex-1-ene-1,4-dicarboxylic acid (8). A solution of 0.103 g ( 0.53 mmol ) of 4-vinyl-cyclohex-1-ene-1, 4-dicarboxylic acid (8) in 10 ml of $7 \%$ aqueous sodium hydrogen carbonate was added to a solution of $0.268 \mathrm{~g}(1.06 \mathrm{mmol})$ iodine and $0.524 \mathrm{~g}(3.16 \mathrm{mmol})$ potassium iodide in 4 ml water. The resulting solution was allowed to stand in the dark for 48 h with occasional swirling and was then diluted with 50 ml water and extracted with chloroform. The aqueous layer was cautiously acidified to $\mathrm{pH} \sim 4$ with dilute hydrochloric acid and extracted with chloroform. The combined extracts were washed with aqueous sodium thiosulfate, dried and evaporated to leave $0.117 \mathrm{~g}(69 \%)$ of 4-iodo-7-oxo-1-vinyl-6-oxabicyclo[3.2.1]octane-4-endo-carboxylic acid (24), m.p. 161-165 ${ }^{\circ}$, as a pale yellow solid. Recrystallization from chloroform/petrol ether gave $0.09 \mathrm{~g}(53 \%)$ of $\mathbf{2 4}, \mathrm{m} . \mathrm{p} .171 .5-174^{\circ}$ as white needles. - IR. $\left(\mathrm{CHCl}_{3}\right): \mathbf{3 6 0 0 - 2 3 0 0} \mathrm{s}$, br.

4.2. Methyl 2(Z)-4-bromo-2-bromomethyl-2-pentenoate (27). A solution of $2.0 \mathrm{~g}(15.06 \mathrm{mmol})$ of methyl $2(E)$-2-methyl-2-pentenoate (25) and $7.60 \mathrm{~g}(42.7 \mathrm{mmol})$ of N -Bromosuccinimide in 250 ml of dry, redistilled carbon tetrachloride was refluxed over a 150 W bulb for 16 h . The reaction product was cooled, the succinimide filtered off and the carbon tetrachloride distilled at $25^{\circ}$ under reduced pressure to give 5.43 g of a yellow oil, shown by TLC. to consist of two species. The mixture was separated into its two components by preparative TLC. on silica gel using ethyl acetate/pentane 1:3. The less-polar fraction was distilled under vacuum to give 0.41 g of a colourless liquid, b.p. $85-90^{\circ} \% .4$ Torr, which was not identified. - IR. (Film): 1745 m ; 1730 s ; $1600 \mathrm{~m} ; 1320 \mathrm{~s} ; 1240 \mathrm{~s} ; 770 \mathrm{~m} ; 750 w$. The more-polar material was distilled under vacuum to give $2.05 \mathrm{~g}(46 \%)$ of methyl $2(\mathrm{Z})$-4-bromo-2-bromomethyl-2-pentenoate (27) as a pale yellow oil, b.p. 102-105 /0.4 Torr. - IR. (Film) : $1720 \mathrm{~s}(\mathrm{C}=\mathrm{O}) ; 1645 \mathrm{~m}(\mathrm{C}=\mathrm{C}) ; 1438 \mathrm{~s} ; 1315 \mathrm{~s} ; 1265 \mathrm{~s} ; 1195 \mathrm{~s}$; $1150 \mathrm{~s} ; 1010 \mathrm{~m} ; 830 \mathrm{~m} ; 770 \mathrm{~s} .-{ }^{1} \mathrm{H}-\mathrm{NMR}$. $\left(60 \mathrm{MHz}, \mathrm{CCl}_{4}\right): 6.83 / \mathrm{d}(J=11), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(3))$; $4.83 / d \times q(J=11$ and 6.5$), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(4)) ; 4.33-3.95 /$ second order $A B$ system $(J=10), 2 \mathrm{H}$ $\left(2 \mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right) ; 3.78 / \mathrm{s}, 3 \mathrm{H}\left(\mathrm{OCH}_{3}\right) ; 1.82 / d(J=6.5), 3 \mathrm{H}\left(\mathrm{H}_{3} \mathrm{C}-\mathrm{C}(4)\right)$.
4.3. Dimethyl 3-methyl-4-(prop-(E)-enyl)-cyclohex-1-ene-7,4-dicarboxylate (29). A mixture of $0.55 \mathrm{~g}(1.92 \mathrm{mmol})$ of methyl 2(Z)-4-bromo-2-bromomethyl-2-pentenoate ( 27 ) and $0.13 \mathrm{~g}(2 \mathrm{mmol})$ of gramulated zinc in 20 ml of anhydrous ether was refluxed for 4 h and then stirred at room temperature for a further 36 h . A grey solid, which had formed as the zinc disappeared, was filtered off and the filtrate evaporated under reduced pressure to give 0.35 g of a pale yellow oil. This was fractionated by preparative TLC. on silica gel using ethyl acetate/pentane 1:3. Two lesspolar bands ( $\mathrm{Rf}=0.6$ and 0.55 ) containing 2 mg and 30 mg respectively of oils were discarded. Extraction with ether of the product from the major band ( $\mathrm{Rf}=0.5$ ), followed by evaporation of the solvent yielded $0.10 \mathrm{~g}(80 \%)$ of a pale yellow oil, which was purified by short path distillation under vacuum to give $0.06 \mathrm{~g}(48 \%)$ of dimethyl 3 -methyl-4-(prop-( E )-enyl)-cyclohex-7-ene-7,4dicarboxylate (29) as a colourless oil, b.p. $80-86^{\circ} / 0.01$ Torr. - UV. $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right): 218(12,300)$. - IR. (Film) : $1725 \mathrm{~s}(\mathrm{C}=\mathrm{O}) ; 1660 \mathrm{~m}(\mathrm{C}=\mathrm{C}) ; 1240-1260 \mathrm{~s}$, br.; $1195 \mathrm{~m} ; 1170 \mathrm{~m} ; 1100 \mathrm{~m} ; 1050 \mathrm{~m}$; 980 m ; $792 \mathrm{~s} ; 770 \mathrm{~m} ; 750 \mathrm{~m} ; 730 \mathrm{w} . \mathbf{- 1}^{1} \mathrm{H}-\mathrm{NMR} .\left(100 \mathrm{MHz}, \mathrm{CCl}_{4}\right): 6.79 / d \times t(J=4.6$ and 2.0$), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(2))$; $5.52 / d \times q(J=14.4$ and 5.0$), 1 \mathrm{H}\left(\mathrm{H}-\mathrm{C}\left(2^{\prime}\right)\right) ; 5.33 / d(J=14.4), 1 \mathrm{H}\left(\mathrm{H}-\mathrm{C}\left(1^{\prime}\right)\right) ; 3.63 / \mathrm{s}, 3 \mathrm{H}$ $\left(\mathrm{OCH}_{3}\right) ; 3.60 / \mathrm{s}, 3 \mathrm{H}\left(\mathrm{OCH}_{3}\right) ; 2.95 / d \times q(J=4.6$ and 7.0$), 1 \mathrm{H}(\mathrm{H}-\mathrm{C}(3)) ; 2.4-1.5 / m, 4 \mathrm{H}(2 \mathrm{H}-\mathrm{C}(5)$, $2 \mathrm{H}-\mathrm{C}(6)) ; 1.71 / d(J=5.0), 3 \mathrm{H}\left(\mathrm{CH}_{3}-\mathrm{C}\left(2^{\circ}\right)\right) ; 0.96 / d(J=7.0), 3 \mathrm{H}\left(\mathrm{CH}_{3}-\mathrm{C}(3)\right)$. Irradiation at $\delta=0.96$ simplified $2.95 / d \times q$ to a doublet $(J=4.6)$. Irradiation at $\delta=6.79$ simplified $2.95 / d \times q$
to a quartet ( $J=7$ ). Double irradiation at $\delta=0.96$ and 6.79 simplificd $2.95 / d \times q$ to a singlet. MS. (70 eV): 252 ( $80, M^{+}$); $220(70) ; 193$ ( 96 ); 161 ( 70 ); 133 (70); 126 (100); 119 (30); 111 (40); 105 (60); 91 (90).

$$
\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{4}(252.32) \quad \text { Calc. } \mathrm{C} 66.64 \quad \mathrm{H} 7.99 \quad \text { Found C } 66.08 \quad \mathrm{H} 7.83 \%
$$

0.14 g of a fraction with $\mathrm{Rf}=0$, probably polymeric, was also present in the mixture.

    ${ }^{4}$ ) University of Zürich, 1968-1971. Present address : Maglemosevej 43, 2900 Hellerup, Danmark.

[^1]:    5) This regiospecificity problem is often referred to [13] as the 'ortho vs. meta' or 'para vs. meta' orientation problem in the Diels-Alder reaction of 1-or 2 -substituted butadienes.
[^2]:    9) Not having realized at that time the history of the compound isolated, we had considered [14] the polarity controlled Diels-Alder structure 7.
    ${ }^{7}$ ) It was postulated [14] that the base treatment applied to the mixture of monobrominated methyl 2-methyl-2-butenoates was responsible for the appcarance of 9 (via 8). This has sinec been confirmed by Dr. Ora Golaberg in this laboratory, who obtained 8 from the action of potassium $t$-butoxide on pure ethyl 2-bromomethyl-2-butenoate. The details will be reported in another connection.
[^3]:    8) Since tnis reaction was first tried in an attempt to achicve a Reformatsky type condensation (compare [20]) 3-methyl-2-cyclohexenone was present in the mixture. It was later found that the debromination of 21 to 9 did not proceed as well in aprotic media when the ketone was absent.
