syn- β -Acyloxy-ketones **6** and an *anti*- β -acyloxy-ketone **17** undergo smooth intramolecular enolate/ester condensations **6** \rightarrow **18** and **17** \rightarrow **19** when treated with $\text{TiCl}_4/\text{EtN}(i\text{-Pr})_2$. Thus, tri- and tetrasubstituted *cis*- or *trans*-2,3-dihydro-4*H*-pyran-4-ones are easily prepared in a stereoselective manner.

Introduction. – Dihydropyranones **I** (*Scheme 1*) are versatile intermediates for the synthesis of tetrahydropyrans, carbohydrates, and acyclic polypropionate segments [1]. Furthermore, several natural products, such as serricorole [2], stegobiol [3], stegobinone [4], vallartanones **A** and **B** [5], maurenone [6], and hepialone [7] contain the dihydropyranone ring **I** as an integral structural element. To date, the best known method to assemble ring system **I** is the *Lewis*-acid-catalyzed cyclocondensation of 1,3-dioxygenated butadienes **II** with aldehydes [1] [8]. Other routes to dihydropyranones **I** rely either on cyclizations of β -(chlorovinyl)- [9] and β -(methoxyvinyl)-3-hydroxy-ketone [10] derivatives **III** or on intramolecular condensations of 5-hydroxy-1,3-diones **IV** [7b] (*Scheme 1*).

An alternative, potentially more attractive approach to polyfunctionalized dihydropyranones **1**, involving the ring closure of β -acyloxy-ketones **V**, suffered in the past from intolerably poor yields [2b] [3]. However, in the preceding article, we describe an efficient synthesis of the dihydropyranone pheromone (–)-serricorole (**3**) which hinges on a new Ti-mediated cyclization **1** \rightarrow **2** (Scheme 2) [11].

We were interested in applying the conditions of reaction **1** \rightarrow **2** to the ring closure of various β -acyloxy-ketones thereby exploring the scope and limitations of this route to multifunctional dihydropyranones.

Preparation of Acyclic β -Acyloxyketones. – Treatment of diethyl ketone (**4**) with (*in situ* prepared) diethylboryl triflate/EtN(*i*-Pr)₂ [12], followed by condensation of the resulting boryl enolate with an aldehyde, gave the expected [13] *syn*-aldols (\pm)-**5** with 90:10 to 96:4 diastereoselectivity. *O*-Acylation of these aldols **5** provided a series of racemic *syn*- β -acyloxy-ketones **6** (Scheme 3, Table 1).

Table 1. Conversion of Diethyl Ketone (**4**) to Racemic *syn*- β -Acyloxy-ketones: **4** \rightarrow (\pm)-**5** \rightarrow (\pm)-**6**

Enantiomerically pure oxopentyl propionate (1*S*,2*R*)-**6a** was obtained from crystalline *syn*-aldol **7** [11] [14] by a reaction sequence similar to that employed for the synthesis of (–)-serricorole (**3**) [11] (Scheme 4).

Thus, *O*-silylation **7** → **8**, nucleophilic displacement of the sultam auxiliary with dilithiated ethyl phenyl sulfone **8** → **9** + **10**, reductive removal of the sulfone group **10** → **11**, desilylation **11** → **5a**, and *O*-acylation of **5a** provided (1*S*,2*R*)-**6a**.

The *anti*-oxobutyl propionate (1*S*,2*S*)-**17** was similarly prepared *via* cleavage of crystalline *N*-(silyloxyacyl)sultam **12** [11] [15] with dilithiated methyl phenyl sulfone¹⁾, C,*S*-hydrogenolysis (Al/Hg, aq. THF), desilylation, and *O*-acylation (Scheme 5).

Cyclization. – The stage was now set to probe the generality of the β -acyloxy-ketone/dihydropyranone cyclization method. Our results are summarized in Schemes 6 and 7 and in Table 2.

Thus, TiCl₄ (1.5 mmol), followed by EtN(*i*-Pr)₂ (3 mmol) were added to a solution of oxopentyl propionate (\pm)-**6a** (1 mmol) in CH₂Cl₂ (10 ml) at –78°. The mixture was stirred at –78° for 1 h, then warmed slowly to –10° and kept at that temperature for 16 h. Workup and chromatography provided racemic *cis*-dihydropyranone **18a** in 81% yield

¹⁾ The cleavage of *N*-acylbornane-10,2-sultams with dilithiated ethyl phenyl sulfone is relatively slow and accompanied by partial epimerization at C(α). *N*-Acyltoluenesultams, on the other hand, undergo smooth displacement of the sultam group by a variety of alkyl phenyl sulfones [16].

(Entry 1). Compound (2*S*,3*R*)-**18a** was obtained from the enantiomerically pure precursor **6a** in an analogous fashion (82%; Entry 2). Employing a similar protocol²⁾, a variety of *cis*-dihydropyranones **18** were generally obtained in good yields from acyloxy-ketones **6**, the modest yield of dihydropyranone **18d** being possibly due to facile ester enolate formation of the *O*-phenacetyl derivative **6d**. Yields of **18** increased with increasing bulk of the ester substituent (Entries 6 < 1 < 3 < 4). Ph- and propenyl-substituted oxo-esters **6f** and **6g** were preferably cyclized at higher dilution (Entries 7 and 8).

The *cis*-products **18** were accompanied by minor amounts of *trans*-isomers in proportions which correspond to the *syn*/*anti* ratios of the acyloxy-ketone precursors **6**. Hence, cyclizations **6** → **18** proceed without noticeable C(α)-epimerization.

Analogous ring closure of enantiomerically pure *anti*-oxobutyl propionate **17** gave C(2)/C(3)-*trans*-substituted pyranone **19** (52%) carrying no substituent at C(5) (Scheme 7).

²⁾ It was of little relevance whether TiCl₄ and EtN(*i*-Pr)₂ were added to the acyl-ketone (Entries 1 and 3–5), or whether TiCl₄ was added to a mixture of oxo-ester and EtN(*i*-Pr)₂ (Entries 2 and 6–8). The cyclization **1** → **2** required 5 mol-equiv. of TiCl₄ and 8 mol-equiv. of EtN(*i*-Pr)₂ to ensure complete consumption of starting material [11].

The decisive role of TiCl_4 in the cyclocondensations $\text{V} \rightarrow \text{I}$ may be rationalized as depicted in *Scheme 8*.

Coordination of Ti^{IV} with the ester $\text{C}=\text{O}$ group should accelerate the cyclization of enolates **VI** ($\text{Met} = \text{Ti}^{\text{IV}}$) to give tetrahedral intermediates **VII** which undergo irreversible elimination to the dihydropyranone products **I** by facile departure of OTiCl_3 ³⁾. The poor yields of dihydropyranone **2** previously obtained by successive treatment of acyloxyketone **1** with lithium hexamethyldisilazide and aqueous acid [2b] [11] may be ascribed to a tetrahedral intermediate **VIII** which eliminates with departure of the endocyclic O-atom rather than with departure of the poor lithium-alkoxide leaving group. Resulting 1,3-dione enolate **IX** could undergo various side reactions prior to its acid-promoted conversion to **I**.

Conclusion. – A series of tri- and tetrasubstituted 2,3-dihydro-4*H*-pyran-4-ones were readily obtained in a single step from β -acyloxyketones. To our knowledge, this is the first general process providing tetrasubstituted 2,3-dihydro-4*H*-pyran-4-ones in good yield and in a stereocontrolled manner. The ready availability of stereochemically pure β -acyloxyketone precursors by established asymmetric aldolization methodology renders this approach particularly attractive.

Preparation of β -Acyloxy-ketones. – (4*RS*,5*SR*)-5-Hydroxy-4-methylheptan-3-one ((\pm)-**5a**). A soln. of EtN(i-Pr)₂ (10.8 ml, 62 mmol) in CH₂Cl₂ (20 ml), followed by diethyl ketone (**4**; 6 ml, 56.4 mmol) were added at –78° to a 1M soln. of *in situ* prepared diethylboryl triflate [12] in hexane (57.7 ml). Stirring of the mixture at –78° for 30 min, addition of propanol (8 ml, 112 mmol), stirring of the mixture for 1 h, addition of aq. phosphate buffer (pH 7), extraction (Et₂O), and FC (hexane/AcOEt 6:1) furnished (\pm)-**5a** (oil, 5.8 g, 71%) as a 96:4 mixture of *s-cis/s-trans*-isomers (¹H-NMR of *s-trans*-isomer: H–C(5) at 3.65 (*m*, 1 H)). IR: 3571, 3024, 2976, 2939, 2879, 1698, 1460, 1409, 1379. ¹H-NMR (major *s-cis*-isomer): 0.95 (*t*, *J* = 7.5, 3 H); 1.06 (*t*, *J* = 7.0, 3 H); 1.13 (*d*, *J* = 7.0, 3 H); 1.38 (*m*, 1 H); 1.53 (*m*, 1 H); 2.47 (*q*, *J* = 7, 1 H); 2.51 (*q*, *J* = 7, 1 H); 2.66 (*q*, *J* = 7, 1 H); 2.76 (*d*, *J* = 3, 1 H); 3.82 (*m*, 1 H). ¹³C-NMR: 216.71 (*s*); 72.56 (*d*); 49.29 (*d*); 35.07 (*t*); 26.84 (*t*); 10.39 (*q*); 9.90 (*q*); 7.57 (*q*).

(1*RS*,2*RS*)-1-Hydroxy-2-methyl-1-phenylpentan-3-one ((\pm)-**5b**). Following the procedure described for the preparation of (\pm)-**5a**, **4** (2.45 ml, 23.2 mmol) was treated successively with EtN(i-Pr)₂ (4.45 ml, 25.5 mmol), diethylboryl triflate (24.36 mmol), and benzaldehyde (2.8 ml, 27.84 mmol). FC (hexane/AcOEt 4:1) gave (\pm)-**5b** (oil, 3.62 g, 81%) as a 96:4 mixture of *s-cis/s-trans*-isomers (¹H-NMR of *s-trans*-isomer: H–C(1) at 4.74 (*dd*, *J* = 8, 4, 1 H)). IR: 3514, 3024, 3027, 3009, 2982, 2940, 1698, 1494, 1452, 1408, 1379, 1224. ¹H-NMR: 0.99 (*t*, *J* = 7.0, 3 H); 1.08 (*d*, *J* = 7.0, 3 H); 2.32 (*dq*, *J* = 18, 7.0, 1 H); 2.49 (*dq*, *J* = 18, 7.0, 1 H); 2.84 (*dq*, *J* = 4.0, 7.0, 1 H); 3.21 (*d*, *J* = 2.5, 1 H); 5.03 (*dd*, *J* = 2.5, 4.0, 1 H). ¹³C-NMR: 216.12 (*s*); 141.82 (*s*); 128.20 (*d*); 127.30 (*d*); 125.90 (*d*); 73.30 (*d*); 52.30 (*d*); 35.38 (*t*); 10.60 (*q*); 7.40 (*q*).

(4*RS*,5*SR*,*E*)-5-Hydroxy-4-methyloct-6-en-3-one ((\pm)-**5c**). Following the procedure described for the preparation of (\pm)-**5a**, **4** (2.45 ml, 23.2 mmol) was treated successively with EtN(i-Pr)₂ (4.45 ml, 25.5 mmol), diethylboryl triflate (24.36 mmol), and (*E*)-crotonaldehyde (2.8 ml, 34.8 mmol). FC (hexane/AcOEt 4:1) gave (\pm)-**5c** (oil, 2.49 g, 69%) as a 90:10 mixture of *s-cis/s-trans*-isomers (¹H-NMR of *s-trans*-isomer: H–C(5) at 4.15 (*m*, H)). IR: 3603, 3507, 3024, 3011, 2980, 2940, 2280, 1698, 1459, 1408, 1378, 1356, 1224. ¹H-NMR: 1.04 (*t*, *J* = 7.0, 3 H); 1.13 (*d*, *J* = 7.0, 3 H); 1.69–1.71 (3 H); 2.44–2.60 (2 H); 2.66 (*m*, 1 H); 4.41 (*m*, 1 H); 5.45 (*ddq*, *J* = 7.0, 15, 2.0, 1 H); 5.69 (*m*, 1 H). ¹³C-NMR: 215.73 (*s*); 130.60 (*d*); 128.00 (*d*); 128.00 (*d*); 50.60 (*d*); 35.47 (*t*); 17.70 (*q*); 11.11 (*q*); 7.50 (*q*).

(1*RS*,2*SR*)-1-Ethyl-2-methyl-3-oxopentyl Propanoate ((\pm)-**6a**). Propanoyl chloride (0.4 ml, 4.32 mmol) was added at 0° to a soln. of (\pm)-**5a** (0.5 g, 3.46 mmol) in CH₂Cl₂/pyridine (5:1, 12 ml). Stirring of the mixture at 0° for 20 h, addition of 1M aq. HCl, and workup gave crude ester (\pm)-**6a**. GC (80/5/10/270): 9.78 (91), 9.94 (3.8, *s-trans*-isomer). FC (hexane/AcOEt 10:1) gave pure (\pm)-**6a** (oil, 602 mg, 87%) as 96:4-mixture of *s-cis/s-trans*-isomers. IR: 3028, 2977, 2941, 2881, 1728, 1716, 1461, 1380, 1350, 1275, 1231, 1193. ¹H-NMR: 0.89 (*t*, *J* = 7.0, 3 H); 1.04 (*t*, *J* = 7.0, 3 H); 1.07 (*d*, *J* = 7.0, 3 H); 1.14 (*t*, *J* = 7.0, 3 H); 1.56 (*quint.*, *J* = 7.0, 2 H); 2.32 (*q*, *J* = 7.0, 2 H); 2.43 (*dq*, *J* = 18, 7.0, 1 H); 2.57 (*dq*, *J* = 18, 7.0, 1 H); 2.77 (*dq*, *J* = 5.5, 7.0, 1 H); 5.13 (*br. q*, *J* = 6.0, 1 H). ¹³C-NMR: 212.07 (*s*); 173.99 (*s*); 74.96 (*d*); 49.05 (*d*); 35.17 (*t*); 27.65 (*t*); 25.12 (*t*); 11.36 (*q*); 10.00 (*q*); 9.20 (*q*); 7.66 (*q*).
