# 53. First Use of Benzyl Phosphites in the Michaelis-Arbuzov Reaction 

Synthesis of Mono-, Di-, and Triphosphate Analogs

(30.XI. 94)

#### Abstract

Benzyl phosphites were used in the Michaelis-Arbuzov reaction. Special experimental conditions allowed preparation of a set of phosphonate analogs of mono-, di-, and triphosphate. Furthermore, regioselective monodeprotection makes these molecules useful building blocks for the synthesis of analogs of polyphosphorylated compounds of biological interest (e.g. nucleotides), after removal of all phosphonate benzyl ester groups under very mild conditions and high yields.

Introduction. - Drastic and non-selective reaction conditions are generally necessary for the hydrolysis of phosphonic diesters $\mathbf{A}$ to acids $\mathbf{C}$ (via monoesters $\mathbf{B}$ ). Depending on the nature of $\mathrm{R}^{1}$ and $\mathrm{R}^{2}$, the hydrolysis can be achieved using acidic, basic, or nucleophilic conditions that do not always fully respect the integrity of the $R^{3}$ group [1-3]. In addition, it is often problematic to perform monodeprotection $(\rightarrow \mathbf{B})$ of phosphonates $\mathbf{A}$ due to the lack of selectivity during the hydrolyses. To overcome these difficulties, we have tried to take advantage of the benzyl moiety as protective group and planned to prepare benzyl phosphonates using the Arbuzov reaction.

The Michaelis-Arbuzov rearrangement is one of the most extensively investigated reaction in organophosphorus chemistry and is widely used to prepare phosphonates, phosphinates, and phosphine oxides [4-11]. In the case of the reaction of trialkyl phosphites 1 with halides 2 (Scheme la), the rearrangement to phosphonates 3 with the formation of alkyl halides 4 proceeds especially easily when the alkyl group R of $\mathbf{1}$ is a good electron-donating group and increases the nucleophilicity of the trivalent P -atom. In the reaction with Mel the reactivity of $\mathbf{1}$ increases with the sequence $\mathrm{R}=\mathrm{Me}<\mathrm{Et}$ $<\mathrm{i}-\operatorname{Pr}[12]$. Besides, the yield of the reaction will depend on the nature of the generated halide $\mathbf{4}$ since it can also be a target for nucleophilic attack by phosphite $\mathbf{1}(\boldsymbol{\rightarrow 5})$ and thus compete with halide 2 (Scheme $I b$ ).

So it is essential that halide $\mathbf{4}$ is efficiently removed from the reaction medium or alternatively that it is less reactive than halide $\mathbf{2}$ to avoid formation of $\mathbf{5}$ in high yield. For these reasons, the Michaelis-Arbuzov reaction was essentially worked out with low molecular weight phosphites (e.g. $\left.(\mathrm{MeO})_{3} \mathrm{P},(\mathrm{EtO})_{3} \mathrm{P},(\mathrm{i}-\mathrm{PrO})_{3} \mathrm{P},(\mathrm{BuO})_{3} \mathrm{P}\right)$. In these cases, the volatile by-product 4 can be removed from the reaction mixture by distillation as it forms.

Results and Discussion. - Monophosphate Analogs. Up to now, the only reported examples of the Michaelis-Arbuzov reaction using benzyl phosphites in the literature refer to the intramolecular photo-Arbuzov rearrangement [13]. Tribenzyl phosphite (6) in the presence even of a catalytic amount of alkyl halide is rapidly and totally converted into the corresponding benzylphosphonate 7 (Scheme 2a), i.e., the use of benzyl phosphites in the Michaelis-Arbuzov reaction requires an efficient removal of the benzyl halide (preferentially chloride) generated during the reaction. This can be satisfactorily achieved at high temperature ( $140^{\circ}$ ) and reduced pressure (4-20 Torr). Such reaction conditions give access to dibenzyl alkylphosphonates provided, however, that reagent halide $\mathbf{2}$ is not volatile under the conditions used. This synthetic pathway readily allows the preparation of alkyl benzyl phosphonates 9 from mixed alkyl benzyl phosphites 8 (Scheme $2 b$ ).

As a matter of fact, a benzyl group is more sensitive than an alkyl group R to the nucleophilic attack by the halide anion (Scheme la), resulting in the formation of BnX instead of RX. From dibenzyl methyl phosphite (10), mixed benzyl methyl phosphonates 11 are obtained that can be selectively monodeprotected either at the benzyl group ( $\rightarrow \mathbf{1 2}$ ) by hydrogenolysis or at the methyl group $(\rightarrow \mathbf{1 3})$ using potassium cyanide [3e] (Scheme $2 c$ ). That sequence is especially useful for the synthesis of building blocks including one or more methylene bis(phosphonate) moieties.

Diphosphate and Triphosphate Analogs. Di- and triphosphates D are widespread chemical species in nature (nucleosides, isoprenoids, and thiamin polyphosphates, NADP etc.). However, the poor stability of pyrophosphates drastically reduces the fields of investigations related to these compounds. There is, consequently, a real need for non-hydrolyzable analogs of such biological species. A way to stabilize a di- or triphosphate sequence $\mathbf{D}$ is to replace the O -atom of pyrophosphate with a methylene group (see E; Scheme 3a) [14]. The synthesis of that kind of structures can be realized using a sequence involving one or two successive Michaelis-Arbuzov rearrangements starting from (chloromethyl)phosphonic or bis(chloromethyl)phosphinic esters $\mathbf{F}$ and $\mathbf{G}$, respectively [15]. These compounds are readily prepared starting from sodium hypophosphite [16], e.g. the benzyl esters $\mathbf{1 6}$ and $\mathbf{1 7}$ via $\mathbf{1 4}$ and $\mathbf{1 5}$, respectively (Scheme $3 b$ ).

(Chloromethyl)phosphonate 16 and bis(chloromethyl)phosphinate 17 react with tribenzyl phosphite (6) to yield the perbenzyl esters of diphosphate analog 18 and triphosphate analog 20 (Scheme 3c). It is noteworthy that during the double Arbuzov reaction with 17 via 19 , benzyl ester 17 is partially dragged off the reaction mixture by distillation. However, the overall yield of $\mathbf{2 0}$ is $71 \%$.

To increase the yield of the double Arbuzov reaction, different benzyl esters with higher boiling points were prepared from 15, i.e. 21-23 (Scheme $4 a$ ). These three phosphinates react with tribenzyl phosphite (6) under the same experimental conditions as described for 17. The results obtained are specified in the Table. Surprisingly, with phosphinates 21 and 22, compound 20 is obtained revealing a transesterification at the central P -atom. However, there is no benzyl alcohol in the reaction mixture, thus classical transesterification mechanism cannot be invoked. It seems likely that the benzylic position is very sensitive to a nucleophilic attack by $\mathrm{Cl}^{-}$anions. Therefore, the reaction product accounts for an 'abnormal' Arbuzov rearrangement resulting from an intramolecular attack by $\mathrm{Cl}^{-}$at the benzylic position on the phosphinate (Path A) instead of one on the phosphite (Path B; Scheme 4b).

The same mechanism (Path $A$ ) could be invoked for the reaction of 17 with tribenzyl phosphite (6), but it results in the same product as in the classical Arbuzov reaction. However, when steric hindrance at the benzylic position is enhanced with a tert-butyl group (see 23), there is no more intramolecular attack by $\mathrm{Cl}^{-}$, and the Arbuzov reaction proceeds normally to give 24 (see Table). As phosphinate 23 is less volatile than 17, the overall yield of the double Michaelis-Arbuzov reaction can be increased to $83 \%$.

Due to the use of a large excess of tribenzyl phosphite ( $\mathbf{6}$; i.e., 4-5 equiv.) in the reaction with the phosphinates, the formation of (chloro)diphenylmethane (25) or 1(chloromethyl)naphthalene (from 21) further reacting with 1 equiv. of phosphite cannot account for the lower yield obtained with $\mathbf{2 1}$ and $\mathbf{2 2}$ in this reaction. This should be more likely attributed to thermal degradation of the phosphinate during the course of the reaction.

Furthermore, the scope of this new approach is enlarged by introducing on the protected di- or triphosphate analog a methyl-ester group easily removable under conditions respecting the integrity of benzyl esters [3e]. Thus, the synthesis of methylenebis-

(phosphonate) monomethyl esters is achieved using mixed dibenzyl methyl phosphite (10) and $\mathbf{1 6}$ or $\mathbf{1 9}$ (Scheme 5a); benzyl methyl esters 27 and 29, respectively, are obtained in 65 and $85 \%$ yield, and no trace of perbenzyl esters $\mathbf{1 8}$ and $\mathbf{2 0}$, respectively, can be detected. Selective deprotection of the methyl esters is achieved using KCN in DMF, and monoacids $\mathbf{2 8}$ and $\mathbf{3 0}$ are quantitatively obtained.

On the other hand, fully deprotected di- and triphosphate analogs 31 and 32 are quantitatively obtained from perbenzyl esters $\mathbf{1 8}$ and $\mathbf{2 0}$ via hydrogenolysis using $\mathrm{Pd} / \mathrm{C}$ (Scheme $5 b$ ). Compounds $\mathbf{3 1}$ and $\mathbf{3 2}$ can then be specifically esterified following well established procedures [17-26].

Conclusion. - The use of benzyl phosphites in the Michaelis-Arbuzov reaction requires the efficient removal of benzyl chloride generated in situ. This is achieved performing the reaction at high temperature under vacuum.

The use of mixed alkyl benzyl phosphites provides a convenient synthetic route to monodeprotected phosphonic acid esters that can be further esterified. Consequently, building blocks such as 28 and $\mathbf{3 0}$ allow the straightforward preparation of di- and triphosphate analogs of various alcohols of interest (nucleosides, vitamins, etc.) via a coupling reaction prior to selective removal of all benzyl groups by hydrogenolysis (Scheme 6).

## Experimental Part

General. THF and $\mathrm{Et}_{2} \mathrm{O}$ were distilled over $\mathrm{Na} /$ benzophenone and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ over $\mathrm{CaH}_{2}$, just before use. Reactions were monitored by TLC (Merck precoated plates 0.25 mm , silica gel $60 F_{254}, 0.040-0.060 \mathrm{~mm}, 230-400$ mesh ASTM). Liquid chromatography: silica gel 60 (Merck, $0.040-0.060 \mathrm{~mm}, 230-400$ mesh ASTM). IR Specira:

Perkin-Elmer-1600-FT spectrometer; absorption values in $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}-,{ }^{13} \mathrm{C}$-, and ${ }^{31} \mathrm{P}$-NMR Spectra: Bruker-WP-$200-\mathrm{Sy}$ spectrometer; chemical shifts $\delta$ in ppm rel. to an internal reference ( ${ }^{1} \mathrm{H}: \mathrm{CHCl}_{3}$ at 7.27 ppm or $\mathrm{CD}_{2} \mathrm{HOD}$ at $3.31 \mathrm{ppm} ;{ }^{13} \mathrm{C}: \mathrm{CDCl}_{3}$ at 77.0 ppm or $\mathrm{CD}_{3} \mathrm{OD}$ at $49.0 \mathrm{ppm} ;{ }^{31} \mathrm{P}: \mathrm{H}_{3} \mathrm{PO}_{4}$ at 0.00 ppm$), J \mathrm{in} \mathrm{Hz}$. Mass spectra: Finnigan-4600 quadrupole instrument; for compound 32, VG-ZAB-HF double-focussing instrument fitted with a Xe -atom gun (negative-ion mode, nitrilotris(ethanol) matrix); $\mathrm{Cl}=$ chemical ionization, $\mathrm{FAB}=$ fast-atom-bombardment ionization.

Tribenzyl Phosphite (6). Anh. $\mathrm{Et}_{3} \mathrm{~N}$ ( $123.8 \mathrm{ml}, 888.3 \mathrm{mmol}, 3.1$ equiv.) is added dropwise to $\mathrm{PCl}_{3}(25.0 \mathrm{ml}$, $286.5 \mathrm{mmol}, 1.0$ equiv.) in anh. $\mathrm{Et}_{2} \mathrm{O}(1.51)$ at $-78^{\circ}$ under Ar. The mixture is treated dropwise with benzyl alcohol ( $89.0 \mathrm{ml}, 859.6 \mathrm{mmol}, 3.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(300 \mathrm{ml})$ and stirred for 2 h at $-78^{\circ}$ and then for 8 h at r.t. The precipitate is removed by filtration and the filtrate evaporated. The residue is chromatographed ( $\mathrm{Et}_{2} \mathrm{O} / \mathrm{hexane}^{2} / \mathrm{Et}_{3} \mathrm{~N} 40: 60: 1$ ): $6\left(90.0 \mathrm{~g}, 89 \%\right.$ ). Colourless liquid. TLC ( $\mathrm{Et}_{2} \mathrm{O} /$ hexane/ $\mathrm{Et}_{3} \mathrm{~N} 50: 50: 1$ ): $R_{\mathrm{f}} 0.5$. Dibenzyl Benzylphosphonate (7). Ester $6(10.0 \mathrm{~g}, 28.4 \mathrm{mmol}, 1.0$ equiv.) and benzyl chloride ( $0.4 \mathrm{~g}, 2.8 \mathrm{mmol}$, 0.1 equiv.) are stirred for 10 h at $140^{\circ}$. The crude mixture is chromatographed ( $\mathrm{Et}_{2} \mathrm{O} /$ hexane $\left.7: 3 \rightarrow 10: 0\right): 7(8.8 \mathrm{~g}$, $88 \%$ ). Colourless oil that crystallizes on standing. TLC ( $\mathrm{Et}_{2} \mathrm{O}$ ): $R_{f} 0.5$. IR (liq.) : 3089, 3032, 2893, 1603, 1496, 1455, 1378, 1249, 1217, 997. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): 7.32-7.27(\mathrm{~m}, 15 \mathrm{H}) ; 4.93(d, J=8.3,4 \mathrm{H}) ; 3.20(d, J=21.5$, $2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): 136.30(d, J=5.6) ; 131.17(d, J=9.1): 129.81 ; 129.68 ; 128.35 ; 128.14 ; 127.74$; 126.81; 126.74; $67.48(d, J=6.6) ; 33.99(d, J=137.1) .{ }^{31} \mathrm{P}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 81.015 \mathrm{MHz}\right): 28.11$.

Dibenzyl Methyl Phosphite (10). Anh. $\mathrm{Et}_{3} \mathrm{~N}\left(123.8 \mathrm{ml}, 888.3 \mathrm{mmol}, 3.1\right.$ equiv.) is added dropwise to $\mathrm{PCl}_{3}(25.0$ $\mathrm{ml}, 286.5 \mathrm{mmol}, 1.0$ equiv.) in anh. $\mathrm{Et}_{2} \mathrm{O}(1.5 \mathrm{l})$ at $-78^{\circ}$ under Ar. The mixture is treated dropwise with benzyl alcohol ( $59.6 \mathrm{ml}, 573.0 \mathrm{mmol}, 2.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(300 \mathrm{ml})$ and stirred for 5 h at $-78^{\circ}$ before anh. $\mathrm{MeOH}(11.6 \mathrm{ml}$, $286.5 \mathrm{mmol}, 1.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(200 \mathrm{ml})$ is slowly added. The mixture is warmed to r.t. and stirred for 4 h prior to filtration. The filtrate is evaporated and chromatographed ( $\mathrm{Et}_{2} \mathrm{O} /$ hexane $\left./ \mathrm{Et}_{3} \mathrm{~N} 50: 50: 1\right): 10(47.5 \mathrm{~g}, 60 \%)$. Colourless liquid. TLC ( $\mathrm{Et}_{2} \mathrm{O} /$ hexane $/ \mathrm{Et}_{3} \mathrm{~N} 60: 40: 1$ ): $R_{\mathrm{f}} 0.5$. IR (liq.): 3080, 3067, 3031, 2940, 2876, $\mathrm{I} 604,1497,1454$, 1375, 1211, 994, 787. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): 7.38-7.36(\mathrm{~m}, 10 \mathrm{H}) ; 5.01(d, J=7.7,4 \mathrm{H}) ; 3.65(d, J=11.0,3$ H). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): 137.93(d, J=6.2) ; 128.10 ; 126.95 ; 126.86 ; 63.62(d, J=11.1) ; 48.76(d$, $J=10.1) .{ }^{31} \mathrm{P}$-NMR $\left(\mathrm{CDCl}_{3}, 81.015 \mathrm{MHz}\right): 20.17$.

Dibenzyl (Chloromethyl)phosphonate (16). Anh. $\mathrm{Et}_{3} \mathrm{~N}(10.3 \mathrm{ml}, 73.9 \mathrm{mmol}, 3.0$ equiv.) is added dropwise to (chloromethyl)phosphonic dichloride (14) [17] ( $4.1 \mathrm{~g}, 24.5 \mathrm{mmol}, 1.0$ equiv.) in THF ( 300 ml ) at $0^{\circ}$. Benzyl alcohol ( $5.6 \mathrm{ml}, 53.9 \mathrm{mmol}$, 2.2 equiv.) in THF ( 50 ml ) is added dropwise and the mixture stirred at $0^{\circ}$ for 1 h and then at r.t. for 4 h . The precipitate is filtered, the filtrate evaporated, and its residue chromatographed $\left(\mathrm{Et}_{2} \mathrm{O} /\right.$ hexane $\mathrm{I}: 1 \rightarrow \mathrm{l}: 0): \mathbf{1 6}(6.3 \mathrm{~g}, 83 \%)$. Colourless oil. TLC ( $\mathrm{Et}_{2} \mathrm{O} /$ hexane $1: 1$ ): $R_{f} 0.3$. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): 7.37-7.35$ $(m, 10 \mathrm{H}) ; 5.07\left(4 B\right.$ of $\left.A B X, J_{A B}=13.8, J_{A X}=8.8, J_{B X}=7.8, v_{A}=5.16, v_{B}=5.06,4 \mathrm{H}\right) ; 3.49(d, J=10.5,3 \mathrm{H})$. ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): 135.80 ; 128.02 ; 127.89 ; 68.76(d, J=6.8) ; 31.19(d, J=91.7) . \mathrm{CI}-\mathrm{MS}\left(\mathrm{NH}_{3}\right): 328.4$ $\left(\left[M+\mathrm{NH}_{4}\right]^{+}\right)$.

Benzyl Bis(chloromethyl)phosphinate (17). Anh. $\mathrm{Et}_{3} \mathrm{~N}(16.9 \mathrm{ml}, 121.3 \mathrm{mmnol}, 1.1$ equiv.) is added dropwise to bis(chloromethyl)phosphinic chloride (15) [17] ( $20.0 \mathrm{~g}, 110.3 \mathrm{mmol}, 1.0$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(400 \mathrm{ml})$ at $0^{\circ}$. Benzyl alcohol ( $12.6 \mathrm{ml}, 121.3 \mathrm{mmol}, 1.1$ equiv.) in $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{ml})$ is added dropwise. The mixture is stirred at $0^{\circ}$ for 1 h , then at r.t. for 2 h . The precipitate is filtered the filtrate evaporated, and its residue chromatographed $\left(\mathrm{Et}_{2} \mathrm{O} /\right.$ hexane $6: 4 \rightarrow 10: 0): 17(24.6 \mathrm{~g}, 88 \%)$. Colourless oil. TLC ( $\mathrm{Et}_{2} \mathrm{O}$ ): $R_{\mathrm{f}} 0.5$. IR (liq.) : $3091,3050,3000,2950,2895,1498,1456$, 1393, 1262, 1200, 1110, 1007, 847. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): 7.45-7.37(m, 5 \mathrm{H}) ; 5.19(d, J=9.3,2 \mathrm{H}) ; 3.66$

CI-MS $\left(\mathrm{NH}_{3}\right): 778\left(\left[M+\mathrm{NH}_{4}{ }^{+}\right), 761\left(M \mathrm{H}^{+}\right)\right.$.

Tribenzyl Methyl Methylenehis (phosphonate) (27). Phosphite $10(9.3 \mathrm{~g}, 33.6 \mathrm{mmol}, 4.0$ equiv.) and $\mathbf{1 6 ( 2 . 6 \mathrm { g } ,}$ $8.4 \mathrm{mmol}, 1.0$ equiv.) are heated at $140^{\circ} / 10-15$ Torr for 8 h . The crude mixture is purified by chromatography (AcOEt/hexane 7:3): $27\left(2.5 \mathrm{~g}, 65 \%\right.$ ). Colourless oil. TLC: (AcOEt) $R_{\mathrm{f}} 0.3$. IR (liq.): 3090, 3030, 2955, 2890, 1497, $1465,1380,1250,1180,1010 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): 7.35-7.27(\mathrm{~m}, 15 \mathrm{H}) ; 5.19-4.96(\mathrm{~m}, 6 \mathrm{H}) ; 3.68(d$, $J=11.4,3 \mathrm{H}) ; 2.50(t, J=21.1,2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): 136.20 ; 136.14 ; 136.00 ; 128.59 ; 128.48 ; 128.09$; $68.21(d, J=5.5) ; 68.16(d, J=6.6) ; 52.98(d, J=6.5) ; 25.82(t, J=136.0) .{ }^{31} \mathrm{P}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 81.015 \mathrm{MHz}\right)$ : 21.43; 20.19. CI-MS $\left(\mathrm{CH}_{4}\right): 461\left(M \mathrm{H}^{+}\right)$.

Tribenzyl Hydrogen Methylenebis (phosphonate) (28). KCN ( $778 \mathrm{mg}, 11.9 \mathrm{mmol}, 1.1$ equiv.) and $27(5.0 \mathrm{~g}, 10.9$ $\mathrm{mmol}, 1.0$ equiv.) in anh. DMF ( 70 ml ) are stirred for 4 h at $70^{\circ}$. The solvent is evaporated, the residue dissolved in $5 \% \mathrm{HCl}$ soln. ( 50 ml ), and the aq. phase extracted with AcOEt. The org. layer is dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and evaporated: 28 ( $4.6 \mathrm{~g}, 95 \%$; no further purification). Slightly yellow oil. TLC $\left(\mathrm{CH}_{2} \mathrm{Cl} / \mathrm{MeOH} 8: 2\right.$ ): $R_{f} 0.3$. IR (liq.): 3400, 3065, $2956,2894,2662,2238,1607,1497,1455,1380,1254,1016 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): 7.36-7.28(m, 15 \mathrm{H}) ; 5.10$ $(d, J=11.9,2 \mathrm{H}) ; 5.02(d, J=12.0,4 \mathrm{H}) ; 2.57(t, J=21.1,2 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): 136.21(d, J=7.0)$; $135.86(d, J=6.5) ; 128.36 ; 128.31 ; 128.23 ; 128.02 ; 127.87 ; 127.46 ; 68.11(d, J=6.5) ; 67.30(d, J=6.0) ; 26.06(t$, $J=134.5) .{ }^{31} \mathrm{P}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 81.015 \mathrm{MHz}\right): 22.06(d, J=6.2) ; 19.79(d, J=6.2)$. CI-MS $\left(\mathrm{NH}_{3}\right): 446.1\left(M \mathrm{H}^{+}\right)$.

Tribenzyl Methyl $\{[$ (Benzyloxy)phosphorylJbis(methylene) \}bis (phosphonate) (29). Phosphite 10 ( $18.5 \mathrm{~g}, 66.8$ mmol, 4.0 equiv.) and $19\left(8.0 \mathrm{~g}, 16.7 \mathrm{mmol}, 1.0\right.$ equiv.) are heated at $140^{\circ} / 4-10$ Torr for 10 h . The crude mixture is purified by chromatography (silica gel, $\mathrm{Et}_{2} \mathrm{O} / \mathrm{AcOEt} / \mathrm{EtOH} 10: 0: 0 \rightarrow 0: 7: 3$ ): $29(9.0 \mathrm{~g}, 85 \%$ ) as a mixture of 2 diastereoisomers. TLC (AcOEt/EtOH 9:1): $R_{\mathrm{f}} 0.4 .{ }^{1} \mathrm{H}-\mathrm{NMR}(\mathrm{CDCl}, 200 \mathrm{MHz}): 7.38-7.29(\mathrm{~m}, 20 \mathrm{H}) ; 5.16-4.94(\mathrm{~m}$, $8 \mathrm{H}) ; 3.69,3.63(2 d, J=11.5,3 \mathrm{H}) ; 2.87-2.72(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}(\mathrm{CDCl}, 50 \mathrm{MHz}): 135.85(\mathrm{~m}) ; 128.42-127.87$ $(m) ; 68.13-67.77(m) ; 66.95(d, J=6.2) ; 52.75,52.60(2 d, J=6.2) ; 28.87,28.58(2 d d, J=87.3,132.5) .{ }^{31} \mathrm{P}-\mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}, 81.015 \mathrm{MHz}\right): 38.52(s, 1 \mathrm{P}) ; 21.75(s, 1 \mathrm{P}) ; 20.89(s, 1 \mathrm{P}) . \mathrm{Cl}-\mathrm{MS}\left(\mathrm{NH}_{3}\right): 646.0\left(\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}\right)$.

Tribenzyl Hydrogen \{[(Benzyloxy)phosphoryllbis(methylene) \}bis (phosphonate) (30). KCN ( $242 \mathrm{mg}, 3.67$ $\mathrm{mmol}, 1.1$ equiv.) and $29\left(2.10 \mathrm{~g}, 3.34 \mathrm{mmol}, 1.0\right.$ equiv.) in anh. DMF ( 50 ml ) are stirred for 4 h at $70^{\circ}$. The solvent is evaporated and the residue dissolved in $\mathrm{H}_{2} \mathrm{O} / \mathrm{MeOH} 3: 7(50 \mathrm{ml})$ and applied on a cation-exchange resin (Dowex $50 \mathrm{X8}, \mathrm{H}^{+}$form) for 2 h . The polymer is removed by filtration and the filtrate evaporated several times with toluene: $30(1.93 \mathrm{~g}, 94 \%$; not further purified). Slightly yellow syrup. IR (liq.): 3064, 3033, 2953, 2897, 2635, 2306, 1668, $1498,1455,1382,1216,997 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left((\mathrm{D})_{6} \mathrm{DMSO}, 200 \mathrm{MHz}\right): 7.37-7.31(\mathrm{~m}, 20 \mathrm{H}) ; 5.07(d, J=7.2,2 \mathrm{H}) ; 4.97(d$, $J=7.4,6 \mathrm{H}) ; 2.77(t . J=20.1,4 \mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}, 50 \mathrm{MHz}\right): 137.82-137.38(\mathrm{~m}) ; 129.60-128.85(\mathrm{~m}) ; 69.38$ $(d, J=5.7) ; 68.63(d, J=5.7) ; 68.34(d, J=6.3) ; 29.61(d d, J=87.1,130.6) .{ }^{31} \mathrm{P}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 81.015 \mathrm{MHz}\right)$ : $41.21(t, J=4.7,1 \mathrm{P}) ; 18.59(d, J=5.1,2 \mathrm{P})$. CI-MS $\left(\mathrm{NH}_{3}\right): 631.9\left(\left[M+\mathrm{NH}_{4}\right]^{+}\right), 524.2$.

Methylenehis (phosphonic Acid) (31). Ester 18 ( $256 \mathrm{mg}, 0.48 \mathrm{mmol}, 1.0$ equiv.), $10 \% \mathrm{Pd} / \mathrm{C}(26 \mathrm{mg}$ ), and ammonium formate ( $1.50 \mathrm{~g}, 23.80 \mathrm{mmol}, 50.0$ equiv.) are refluxed in $\mathrm{H}_{2} \mathrm{O} / \mathrm{MeOH} 8: 2(10 \mathrm{ml})$ for 1.5 h . The mixture is filtered the filtrate evaporated, and the residue dissolved in $\mathrm{MeOH}(20 \mathrm{ml})$. Acetone ( 10 ml ) is added and the precipitate collected by centrifugation and dried under vacuum: $31(79 \mathrm{mg}, 94 \%)$. White hygroscopic powder. ${ }^{1} \mathrm{H}$-, ${ }^{13} \mathrm{C}$-, and ${ }^{31} \mathrm{P}$-NMR : identical to that of an authentic sample.

Phosphorylbis(methylene)]bis (phosphonic Acid) (32). As described for 31, from $20: 32$ ( $103 \mathrm{mg}, 95 \%$ ). Very hygroscopic white powder. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{D}_{2} \mathrm{O}, 200 \mathrm{MHz}\right): 2.15(d d, J=20.3,18.2)$. ${ }^{31} \mathrm{P}-\mathrm{NMR}\left(\mathrm{D}_{2} \mathrm{O}, 81.015 \mathrm{MHz}\right)$ : $37.3(s, 1 \mathrm{P}) ; 17.5(s, 2 \mathrm{P})$. FAB-MS: $252.9\left([\mathrm{M}-\mathrm{H}]^{-}\right)$.
