#### Abstract

Homooligopeptides containing $\alpha, \alpha$-diethylgycine ( $=2$-amino-2-ethylbutanoic acid), were synthesized by conventional solution methods. An ethyl or methyl ester was used as protecting group at the C-terminus and a trifluoroacetyl group as protecting group at the N-terminus of the peptides. The conformations of such tri-, penta-, and hexapeptides in the solid state were studied using X-ray crystallographic analysis, and were shown to be a bent planar C5-conformation in the case of tripeptide 8a, and a $3_{10}$-helical structure in the case of pentapeptide 10 and hexapeptide 11. IR and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra revealed that the dominant conformation of hexapeptide 11 in $\mathrm{CDCl}_{3}$ solution was not the $3_{10}$-helical structure shown in the solid state, but a fully planar $C 5$ structure.

Introduction. - Non-proteinogenic modified amino acids and their peptides have become some of the most important areas of research in the fields of organic chemistry, medicinal chemistry, and protein engineering [1]. The introduction of alkyl substituents into the $\alpha$-position of an $\alpha$-amino acid ( $\alpha, \alpha$-disubstituted amino acids) is a popular modification method of $\alpha$-amino acids. The $\alpha$-alkyl substituents in $\alpha, \alpha$-disubstituted amino acids severely restrict the conformational freedom of peptides containing such residues. Therefore, these peptides offer a means to investigate the factors which determine the flexibility of a peptide and to construct a stable secondary structure. The introduction of $\alpha, \alpha$-disubstituted amino acids may also provide a way of probing the bioactive conformation of bioactive peptides. The findings that $\alpha$-aminoisobutyric acid $(=\alpha$-methylalanine $=$ dimethylglycine; Aib$)$ and isovaline have been isolated from microorganisms as the peptaibol antibiotics [2] have stimulated peptide chemists to synthesize new peptides containing $\alpha, \alpha$-disubstituted amino acids and to analyze the conformation of the peptides. The conformational studies of $\alpha, \alpha$-disubstituted amino acids and their peptides concentrated on the peptide-bearing Aib because of its simple molecular structure [3][4]. It is already known that Aib strongly stabilizes conformation near the $3_{10} / \alpha$-helical region $\left(\varphi \pm 60^{\circ}, \psi \pm 30^{\circ}\right)$. The propensity for helical conformation has made achiral Aib a tool for the construction of a helical secondary structure in the de novo design of proteins. Besides Aib, few properties of other achiral $\alpha, \alpha$-disubstituted amino acids are known. Homopeptides constructed from diethylglycine (=2-amino-2-ethylbutanoic acid; Deg) [4][5] or dipropylglycine [4][5][6] adopt a planar, fully extended $C 5$ conformation (i.e., $\mathrm{N}(i)-\mathrm{H}$ and $\mathrm{C}(i)=\mathrm{O}$ are involved in a pentagonal ring, together with $\mathrm{C} \alpha(i)$ ) [5], and homopeptides prepared from cyclic $\alpha, \alpha-$ disubstituted amino acids adopt regular $3_{10}$-helical (1-aminocyclobutanecarboxylic acid [7], 1-aminocyclopentanecarboxylic acid [8], and 1-aminocyclohexanecarboxylic acid [9]) and distorted $3_{10}$-helical structures (1-aminocyclopropanecarboxylic acid [10])
(Fig. 1). Very recently, Seebach and co-workers (including one of us) [11] found that the C-terminal and N-terminal protecting groups of homopeptides constructed from isovaline strongly affect their conformations in the solid state [11]. This finding prompted us to study the conformation of the homopeptides prepared from Deg because the computer analysis of their conformation showed almost equal energy difference between the $3_{10}$-helical and planar (C5) conformations [5]. The $3_{10}$-helical conformation of heteropeptides containing dipropylglycine and dibutylglycine were described [6], but only the planar conformation of the homopeptides prepared from Deg was reported [5][12].

Fig. 1. Crystal-state conformations of homopeptides prepared from $\alpha, \alpha$-disubstituted amino acids

Results. - Synthesis of Diethylglycine and of Its Homopeptides. Diethylglycine hydrochloride was prepared from diethyl ketone on the gram scale by treatment with KCN and $\mathrm{NH}_{4} \mathrm{Cl}$ and subsequent hydrolysis of the nitrile by using concentrated aqueous HCl solution, according to Pfister's methods [13] (Scheme).

At first, the trifluoroacetyl group was employed for N -terminal and the methyl ester for C-terminal protection, and the preparation of the homopeptide was attempted from the N -terminus of peptide by solution-phase methods. Thus, dipeptide 5a was synthesized by the coupling of oxazol- $5(4 H)$-one $\mathbf{3}$ and amine $\mathbf{4 a}$ in $90 \%$ yield (Scheme). After saponification of the methyl ester of $\mathbf{5 a}$ by NaOH , acid $\mathbf{6}$ was coupled with amine 4a using 1-ethyl-3-[3-(dimethylamino)propyl]carbodiimide hydrochloride (EDC) via an oxazol-5(4H)-one intermediate 7; unfortunately, the isolated yield of tripeptide 8a was very low (7\%). Therefore, we decided to prepare the homopeptide from the C-terminus, employing an ethyl ester as the C-terminal protection, and achieving the deprotection of the trifluoroacetyl group by $\mathrm{NaBH}_{4}$ reduction in refluxing EtOH . Thus, dipeptide $\mathbf{5 b}$ was prepared in $99 \%$ yield by coupling oxazol$5(4 H)$-one $\mathbf{3}$ and amine $\mathbf{4 b}$. Subsequent deprotection of the trifluoroacetyl function with $\mathrm{NaBH}_{4}$, followed by coupling with oxazol-5(4H)-one 3, yielded tripeptide $\mathbf{8 b}$ in $73 \%$ yield. The tetra-, penta-, and hexapeptides $\mathbf{9}-\mathbf{1 1}$ were synthesized similarly to $\mathbf{8 b}$, except that $\mathbf{3}$ was prepared in situ from EDC and the acid 2 (Scheme).

11
Solid-State Conformational Analysis. We determined the molecular and crystal structures of the three terminally blocked homopeptides $\mathbf{8 a}, \mathbf{1 0}$, and $\mathbf{1 1}$ by X-ray diffraction. Good crystals for X-ray analysis were obtained by slow evaporation of MeOH at room temperature, except for tetrapeptide 9 . The molecular structures with
atomic numbering schemes are shown in Figs. 2-6. Relevant backbone and side-chain torsion angles are given in Table 1. The intra- and intermolecular H-bond parameters are listed in Table 2. Each molecule bearing no chiral centers crystallizes in space groups where centers of symmetry are present.

Fig. 2. ORTEP Drawing of the crystal structure of tripeptide 8a with atom numbering (ellipsoids at $50 \%$ probalility)

In the case of tripeptide 8a, two intramolecular H -bonds are observed in the residue Deg-1 and Deg-3. This indicates that intramolecularly H-bonded $C_{5}$ conformations of Deg-1 and Deg-3 are formed in the solid state. The set of $\phi / \psi$ angles for the amino-acid residues are $-178.1 /+180.0^{\circ}$ for Deg-1 and $+178.4 /-178.5^{\circ}$ for Deg-3. In the packing mode, one intermolecular H -bond is seen between the $\mathrm{H}-\mathrm{N}(2)$ peptide donor and the $\mathrm{C}(2)=\mathrm{O}(2)$ carbonyl O -atom of the peptide of a symmetry-related molecule $(-x+3 /$ $2, y+1 / 2,-z+1 / 2)$, with a $\mathrm{N}(2) \cdots \mathrm{O}(2)$ distance of $2.97 \AA$. The set of $\phi / \psi$ angles for Deg- 2 is $+59.6 /+44.5^{\circ}$. The molecules of both handedness simultaneously occur in the centrosymmetric space group $P 2_{1} / n$ (No. 14). The chains of H-bonded peptide molecules are formed along the $b$ direction in the crystal.

The structure of pentapeptide $\mathbf{1 0}$ was solved in the $P \overline{1}$ (No. 2) space group. Two independent molecules occur in the asymmetric unit of the pentapeptide. Both molecules $A$ and $B$ are folded in the $3_{10}$-helical structure. The molecules have almost the same structures, but they are crystallographically independent molecules, and small differences in the conformations are observed, as shown in Table 1. The enantiomers of the molecules also exist in the crystal because the centers of symmetry are present in the space group of $P \overline{1}$ (No. 2). In molecule $A$, three intramolecular H-bonds are seen,

Fig. 3. ORTEP Drawing of the two independent molecules $\mathbf{A}$ and $\mathbf{B}$ in the asymmetric unit of pentapeptide $\mathbf{1 0}$ with atom numbering, as viewed perpendicularly to the helix axis (ellipsoids at $50 \%$ probability). Only one conformation for the $\mathrm{CF}_{3}$ functions in the molecule $\mathbf{A}$ and $\mathbf{B}$ is displayed. The disorders of $\mathbf{C}$-atoms $\mathrm{C}(\beta)$ and $\mathrm{C}\left(\beta^{\prime}\right)$, and $\mathrm{C}(3 \gamma)$ and $\mathrm{C}\left(3 \gamma^{\prime}\right)$ in the molecule $\mathbf{A}$ are shown.
between $\mathrm{H}-\mathrm{N}(3)$ and the $\mathrm{C}(0)=\mathrm{O}(0)$ carbonyl O -atom of the trifluoroacetyl group with a $\mathrm{N}(3) \cdots \mathrm{O}(0)$ distance of $3.05 \AA$, between $\mathrm{H}-\mathrm{N}(4)$ and $\mathrm{C}(1)=\mathrm{O}(1)$ with a $\mathrm{N}(4) \cdots \mathrm{O}(1)$ distance of $3.15 \AA$, and between $\mathrm{H}-\mathrm{N}(5)$ and $\mathrm{C}(2)=\mathrm{O}(2)$ with the $\mathrm{N}(5) \cdots \mathrm{O}(2)$ distance of $2.97 \AA$. Similarly, three intramolecular H-bonds are also observed in molecule $B$, between $\mathrm{H}-\mathrm{N}(3)$ and $\mathrm{C}(0)=\mathrm{O}(0)$ with $\mathrm{N}(3) \cdots \mathrm{O}(0)$ distance of $3.02 \AA$, between $\mathrm{H}-\mathrm{N}(4)$ and $\mathrm{C}(1)=\mathrm{O}(1)$ with a $\mathrm{N}(4) \cdots \mathrm{O}(1)$ distance of $3.11 \AA$, and between $\mathrm{H}-\mathrm{N}(5)$ and $\mathrm{C}(2)=\mathrm{O}(2)$ with a $\mathrm{N}(5) \cdots \mathrm{O}(2)$ distance of $3.07 \AA$. The mean values of torsion angles $\phi$ and $\psi$ for the sequence Deg- 1 to Deg-4 in molecule $A$ are -53.5 and $-31.0^{\circ}$, respectively. The signs of the $\phi$ and $\psi$ torsion angles ( +43.2 and $+52.8^{\circ}$ resp.) of the Deg-5 residue at the C-terminus are opposite to those of the preceding residues Deg-1 to Deg-4. This structure is widely observed in the structure of the homopeptide prepared from Aib, and is known as the $3_{10}$-helix-terminating structure. The mean $\phi$ and $\psi$ values for the sequence Deg- 1 to Deg- 4 in molecule $B$ are -53.3 and $-31.2^{\circ}$, respectively. The signs of the $\phi$ and $\psi$ angles ( +42.0 and $+52.0^{\circ}$, resp.) at the C -terminus in the molecule $B$ are also opposite to those of the preceding residues. In the packing mode of pentapeptide 10, the intermolecular H-bond is observed in molecule $A$ between the $\mathrm{H}-\mathrm{N}(1)$ peptide donor and the $\mathrm{C}(4)=\mathrm{O}(4)$ carbonyl O-atom of a symmetry-related molecule $(x, y, z+1)$ with a $\mathrm{N}(1) \cdots \mathrm{O}(4)$ distance of $2.77 \AA$ along the $c$ direction. An intermolecular H-bond is also observed in molecule $B$ between the $\mathrm{H}-\mathrm{N}(1)$ donor and the $\mathrm{C}(4)=\mathrm{O}(4)$ acceptor of a symmetryrelated molecule $(x, y, z-1)$ with a $\mathrm{N}(1) \cdots \mathrm{O}(4)$ distance of $2.82 \AA$. The chains of

Fig. 4. ORTEP Drawing of the crystal structure of hexapeptide $\mathbf{1 1}$ with atom numbering, as viewed perpendicularly to the helix axis (ellipsoids at $50 \%$ proability).
intermolecularly H -bonded molecules are formed in a head-to-tail alignment of righthanded $(P) 3_{10}$-helical molecule $A$ and left-handed $(M) 3_{10}$-helical molecule $A$, that is $(\ldots P \ldots P \ldots P \ldots$ and $\ldots M \ldots M \ldots M \ldots$ ) chains of the molecule $A[14]$. Also, the chains of right-handed $(P) 3_{10}$-helical molecule $B$ and left-handed $(M) 3_{10}$-helical molecule $B$ are in a head-to-tail alignment, that is $(\ldots P \ldots P \ldots P \ldots$ and $\ldots M$ $\ldots M \ldots M \ldots$ ) chains of the molecule $B$, are formed. The $\mathrm{N} \cdots \mathrm{O}$ distances observed for intermolecular H-bonds are shorter than those of intramolecular ones.

Hexapeptide $\mathbf{1 1}$ crystallizes in the $P 2_{1} / n$ (No. 14) space group. Only one molecule exists in the asymmetric unit of the hexapeptide. The center of symmetry exists in this space group; therefore, both the right-handed $(P)$ and the left-handed $(M) 3_{10}$-helical structures occur simultaneously in the crystal. Four intramolecular H-bonds are observed, between $\mathrm{H}-\mathrm{N}(3)$ peptide donor and the $\mathrm{C}(0)=\mathrm{O}(0)$ carbonyl O -atom of the trifluoroacetyl group at the N -terminus with a $\mathrm{N}(3) \cdots \mathrm{O}(0)$ distance of $2.94 \AA$, between $\mathrm{H}-\mathrm{N}(4)$ and $\mathrm{C}(1)=\mathrm{O}(1)$ with a $\mathrm{N}(4) \cdots \mathrm{O}(1)$ distance of $3.07 \AA$, between $\mathrm{H}-\mathrm{N}(5)$ and $\mathrm{C}(2)=\mathrm{O}(2)$ with a $\mathrm{N}(5) \cdots \mathrm{O}(2)$ distance of $2.96 \AA$, and between $\mathrm{H}-\mathrm{N}(6)$ and $\mathrm{C}(3)=\mathrm{O}(3)$ with a $\mathrm{N}(6) \cdots \mathrm{O}(3)$ distance of $2.94 \AA$. The mean values of torsion angles $\phi$ and $\psi$ for the sequence Deg-1 to Deg-5 in the hexapeptide are +51.9 and $+32.9^{\circ}$, respectively, as shown in Fig. 4, close to those expected for a left-handed

Fig. 5. ORTEP Drawing of $\mathbf{1 1}$ as viewed along the helix axis (ellipsoids at $50 \%$ probability)
$3_{10}$-helix ( +57 and $+30^{\circ}$ resp.). Fig. 4 shows only a left-handed $3_{10}$-helical structure, but the enantiomer (average $\phi$ and $\psi$ value $=-51.9$ and $-32.9^{\circ}$, resp.) of the molecule exists in the crystal. The $\phi$ and $\psi$ torsion angles ( -47.6 and $-53.1^{\circ}$, resp.) for Deg-6 at the C-terminus have opposite signs to those of the preceding Deg-1 to Deg-5 residues, corresponding to a change in the handedness of the helix. The right-handed $(P) 3_{10}$-helical molecules are connected with the left-handed ( $M$ ) $3_{10}$-helical molecules in a head-to-tail alignment, via intermolecular H-bonds. One is a H-bond between the $\mathrm{H}-\mathrm{N}(1)$ peptide donor and the $\mathrm{C}(5)=\mathrm{O}(5)$ carbonyl O -atom acceptor of a symmetryrelated molecule $(x+1 / 2,-y+1, z+1 / 2)$ with a $\mathrm{N}(1) \cdots \mathrm{O}(5)$ distance of $2.88 \AA$, and the other is a weak H -bond between the $\mathrm{H}-\mathrm{N}(2)$ donor and the $\mathrm{C}(6)=\mathrm{O}(6)$ acceptor of a symmetry-related molecule $(x+1 / 2,-y+1, z+1 / 2)$ with a $\mathrm{N}(2) \cdots \mathrm{O}(6)$ distance of $3.19 \AA$ as shown in Fig. 6. That is to say, the chains of intermolecular H-bonded molecules are of the (...M...P...M...P...) mode. The crystals of 11, recrystallized from $\mathrm{CDCl}_{3}$ or $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$, also gave the same diffraction parameters (Table 3).

Solution Conformational Analysis. The conformational preferences of di- to hexapeptides $\mathbf{5 a}, \mathbf{8 b}, \mathbf{9}, \mathbf{1 0}$, and $\mathbf{1 1}$ were examined in a solvent of low polarity $\left(\mathrm{CDCl}_{3}\right)$ by using FT-IR absorptions at various concentrations in the range of $5.0-0.5 \mathrm{~mm}$. It was expected that all NH functional groups are intramolecularly H -bonded to the carbonyl groups of the same amino-acid residues in the case of a fully extended planar $C 5$ conformation, whereas the NH groups of the Deg-1 and Deg-2 residues are free in the case of a $3_{10}$-helical conformation. Fig. 7 shows the IR absorption in the 3500 $3300 \mathrm{~cm}^{-1}$ region at a peptide concentration of 1.0 mm . The bands at $3435-3450 \mathrm{~cm}^{-1}$ are assigned to free (solvated) peptide NH groups or to amide NH groups with a weak intramolecular H-bond of the $\mathrm{C}-\mathrm{F} \cdots \mathrm{H}-\mathrm{N}$ type, those at $3390-3400 \mathrm{~cm}^{-1}$ to amide NH groups with a relatively stronger $\mathrm{C}-\mathrm{F} \cdots \mathrm{H}(\mathrm{N}) \cdots \mathrm{O}=\mathrm{C}$ intramolecular H-bond,

Fig. 6. View of the crystal structure of 11. The four intramolecular and two intermolecular H-bonds are indicated as dashed lines. Head-to-tail H-bonding in hexpaptide $\mathbf{1 1}$ is shown.
and those at $3340-3360 \mathrm{~cm}^{-1}$ to peptide NH groups with $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}=\mathrm{C}$ intramolecular H-bonds of different strength. The strong absorption at $3340 \mathrm{~cm}^{-1}$ of the dipeptide shifts to slightly higher wavenumbers $\left(3360 \mathrm{~cm}^{-1}\right)$, and also the relative intensity of this absorption band increases gradually with increasing chain length. In the concentration range examined ( $5.0-0.5 \mathrm{~mm}$ ), the IR absorption spectra of the hexapeptide $\mathbf{1 1}$ remain essentially unchanged.

To obtain more detailed information on the conformation of the homopeptides in $\mathrm{CDCl}_{3}$ solution, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ techniques were applied especially to the hexapeptide 11. In the ${ }^{1} \mathrm{H}$-NMR spectrum of $\mathbf{1 1}$ in $\mathrm{CDCl}_{3}$ at room temperature, the $\mathrm{CF}_{3} \mathrm{CO}-\mathrm{NH}$ signal at the N -terminus was unambiguously identified by its high-field position $(\delta 6.77$ (br. $s, 1 \mathrm{H})$ ) [12], and the amide NH signal at the C-terminus $(\delta 8.00$ (br. $s, 1 \mathrm{H})$ ) by analogy with the C-terminal NH signal of dipeptide $\mathbf{5 b}(\delta 7.96$ (br. $s, 1 \mathrm{H})$ ). The precise assignments of the remaining internal four NH protons (Deg-2 to Deg-5) of $\mathbf{1 1}$ could not be made. The chemical shifts of all NH protons in hexapeptide $\mathbf{1 1}$ were essentially independent of the concentration in the examined range of $1.0-50 \mathrm{~mm}$. The ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$ -

NOESY experiment of 11, performed at room temperature, did not show any correlation among the amide NH signals; this correlation would be present in the case of a $3_{10}$-helical conformation. The additional effects of the strong H-bonding acceptor solvent DMSO or the paramagnetic free radical 2,2,6,6-tetramethyl-1-piperidyloxyl (TEMPO) on the chemical shifts of NH signals were measured for the hexapaptide 11, but the NH signals were almost insensitive to the addition of the two perturbing agents DMSO $(0-10 \%(v / v))$ and TEMPO $\left(0-5 \cdot 10^{-2 \%}(w / v)\right)$, as shown in Fig. 8. To detect minor conformations in $\mathrm{CDCl}_{3}$ solution, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of $\mathbf{1 1}$ were measured at low temperature. Unfortunately, the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{1 1}$ exhibited only six signals due to the NH protons, even at $-50^{\circ}$, and no broadening of signals occurred; almost no differences were observed between the spectra measured at room temperature and at $-50^{\circ}$.

Discussion. - The conformations of the penta- and hexapaptide $\mathbf{1 0}$ and $\mathbf{1 1}$ in the solid state are very different from those reported by Toniolo and co-workers [5]. They reported that the pentapeptide containing Deg with a tert-butyl ester as the C-terminal protecting group preferred a fully extended $C 5$-structure in the solid state. However, our results show that the $3_{10}$-helical conformations are preferred in the solid state for $\mathbf{1 0}$. Fig. 9 shows the structure of $\mathbf{1 0}$, as established by X-ray analysis, superimposed on the

Fig. 7. FT-IR Absorption spectra ( $3500-3250 \mathrm{~cm}^{-1}$ region) of the $\mathrm{CF}_{3} \mathrm{CO}-(\operatorname{Deg})_{\mathrm{n}}-\mathrm{OEt}(n=2-6)$ homopeptides in $\mathrm{CDCl}_{3}$ solution (peptide concentration 1.0 mm ): a) $\mathrm{n}=2$, b) $\left.\left.\mathrm{n}=3, \mathrm{c}\right) \mathrm{n}=4, \mathrm{~d}\right) \mathrm{n}=5$ and e) $\mathrm{n}=6$
conformation of the pentapeptide calculated by computer energy minimization. The $3_{10}$-helical conformation determined by X-ray analysis and that obtained by computer calculation are very similar.

Fig. 8. a) Plot of NH chemical shifts in the ${ }^{1} H-N M R$ spectra of hexapeptide 11 as a function of increasing percentages of $\operatorname{DMSO}(\mathrm{v} / \mathrm{v})$ added to the $\mathrm{CDCl}_{3}$ solution (peptide concentration 1.0 mm$)$ and b) plot of the bandwidth of the NH protons of $\mathbf{1 1}$ as a function of increasing percentages of $T E M P O(\mathrm{w} / \mathrm{v})$ added to the $\mathrm{CDCl}_{3}$ solution (peptide concentration 1.0 mm )

Fig. 9. Molecule $\mathbf{A}$ of pentapeptide $\mathbf{1 0}$ as determined by X-ray crystallographic analysis, superimposed on the minimal-energy conformation of the pentapeptide calculated by MacroModel [19]. The rotational disorder of the trifluoroacetyl function is shown in the structure determined by X-ray analysis.

The IR spectrum of pentapeptide $\mathrm{CF}_{3} \mathrm{CO}-(\mathrm{Deg})_{5}-\mathrm{OEt}(\mathbf{1 0})$ is very similar to that of $\mathrm{CF}_{3} \mathrm{CO}-(\mathrm{Deg})_{5}$-O-t-Bu reported by Toniolo and co-workers [5]. These IR absorption data tentatively suggest that the largely populated structure of homopeptides prepared from Deg in $\mathrm{CDCl}_{3}$ solution is not a $3_{10}$-helical structure, but a fully extended $C 5$ conformation. In the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of hexapeptide 11, the internal four NH protons (Deg-2 to Deg-5) appear in the narrow region of $\delta 7.36-7.45$, suggesting that these internal NH protons exist under closely related circumstances in $\mathrm{CDCl}_{3}$ solution. The NH signals of $\mathbf{1 1}$ were almost insensitive to the addition of DMSO and TEMPO which also supports that the $C 5$ conformation is preferred in $\mathrm{CDCl}_{3}$ solution. The absence of splitting and broadening of the NH signals in the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{1 1}$ measured at $-50^{\circ}$ can be attributed to the presence of either only a single conformer (minor conformers in very minute amount) or several conformers in very fast exchange. However, a planar structure existing only in $\mathrm{CDCl}_{3}$ solution would be ruled out, because the crystals, recrystallized from $\mathrm{CDCl}_{3}$, also afforded the same diffraction parameters as those obtained from the crystals recrystallized from MeOH . The dominant conformation in the $\mathrm{CDCl}_{3}$ solution is a planar structure, and this planar conformation in solution is consistent with the results reported by Toniolo and coworkers [5].

Conclusions. - The preferred conformations of the ethyl ester penta- and hexapeptides $\mathbf{1 0}$ and 11, respectively, prepared from Deg were $3_{10}$-helical structures in the solid state. We established the dominant conformation of $\mathbf{1 1}$ in $\mathrm{CDCl}_{3}$ solution to
be fully extended planar (C5) structure. Thus the preferred conformation of $\mathbf{1 1}$ in $\mathrm{CDCl}_{3}$ solution and that in the solid state are drastically different. Two intermolecular H -bonds are present in the $3_{10}$-helical structure of $\mathbf{1 1}$, but none in the planar (C5) structure, and therefore intermolecular H -bonds in a minor $3_{10}$-helical conformation in solution would affect the nucleation events. In the case of tert-butyl ester C-terminal protecting groups [11], the bulky ester prevents the formation of intermolecular H bonds in the $3_{10}$-helical structure, therefore the extended planar structures would be adopted in the solid state. Although $3_{10}$-helical structures were reported for heteropeptides containing dipropylglycine and dibutylglycine [6], the results presented here establish for the first time the $3_{10}$-helical structure as the minimum-energy conformation also for homopeptides prepared from Deg.

## Experimental Part

General. General procedures for syntheses according to previous reports [11][15]. CC = Column chromatography. IR Spectra $\left(\mathrm{cm}^{-1}\right)$ : Jasco-A-100 spectrometer for conventional measurements $(\mathrm{KBr}$ and neat) and Jasco-FT-IR-420 spectrophotometer for $\mathrm{CDCl}_{3}$ solns. using $0.1-\mathrm{mm}$ path length of a NaCl cell. ${ }^{1} \mathrm{H}$-NMR spectra: at $270($ Jeol $G X-270)$ or 500 MHz (Varian Unity-500P); $\delta$ in ppm, $J$ in Hz. EI- and FAB-MS: Jeol-JMS -610 H spectrometer. Elemental analyses were performed in the Analytical Center of the Faculty of Science at Kyushu Unitersity.

Diethylglycine Hydrochloride ( $=2$-Amino-2-ethylbutanoic Acid Hydrochloride; Deg• $\mathrm{HCl} ; 1$ ). A mixture of diethyl ketone ( $63 \mathrm{ml}, 624 \mathrm{mmol}), \mathrm{KCN}(37.2 \mathrm{~g}, 572 \mathrm{mmol})$, and $\mathrm{NH}_{4} \mathrm{Cl}(31.3 \mathrm{~g}, 585 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(170 \mathrm{ml})$ was heated at $55-60^{\circ}$ for 8 h . After being cooled to r.t., the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the extract dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated, and the residue dissolved in conc. aq. HCl soln. ( 350 ml ). After refluxing for 3 days, the soln. was concentrated to $1 / 3$ volume and left at r.t. for 24 h . The precipitated crystals $\mathbf{1}$ were collected ( $38-$ $60 \mathrm{~g}, 40-63 \%$ ). M.p. $245-248^{\circ}$ (sublimed). IR (KBr): $3200,3160,2900$ (br.), 1710 (br.). ${ }^{1} \mathrm{H}-\mathrm{NMR}(270 \mathrm{MHz}$, $\left.\left(\mathrm{D}_{6}\right) \mathrm{DMSO}\right) ; 8.42$ (br. $s, 1 \mathrm{H}$ ); 4.25 (br. $\left.s, 3 \mathrm{H}\right) ; 1.79(q, J=7.4,4 \mathrm{H}) ; 0.87(t, J=7.4,6 \mathrm{H})$. Anal. calc. for $\mathrm{C}_{6} \mathrm{H}_{14} \mathrm{ClNO}_{2}$ : C 42.99, H 8.42, N 8.36, found: C $43.00, \mathrm{H} 8.40, \mathrm{~N} 8.43$.

2,2-Diethyl-N-(trifluoroacetyl)glycine ( $=2$-Ethyl-2-[(trifluoroacetyl)amino]butanoic Acid; $\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}$; 2). A mixture of $\mathbf{1}(10.0 \mathrm{~g}, 59.7 \mathrm{mmol})$ in $\left(\mathrm{CF}_{3} \mathrm{CO}\right)_{2} \mathrm{O}(30 \mathrm{ml})$ was stirred at r.t. for 5 days. The mixture was poured into $5 \%$ aq. $\mathrm{NaHCO}_{3}$ soln. and the soln. acidified with solid citric acid. The acidic soln. was extracted with $\mathrm{CHCl}_{3}$ and the extract dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated: $\mathbf{2}(8.4 \mathrm{~g}, 62 \%)$. Colorless crystals. M.p. $116-117^{\circ}$ (from $\mathrm{CHCl}_{3}$ ). IR (KBr): 3350,3100 (br.), $1730,1700 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ); 8.61 (br. 1 H ); 7.24 (br. $s, 1 \mathrm{H}) ; 2.51(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.95(q d, J=7.4,14.8,2 \mathrm{H}) ; 0.84(t, J=7.4,3 \mathrm{H})$. FAB-MS: 228.2 ( $\left[M^{+}+\right.$ $\mathrm{H}]^{+}$), 182.1. Anal. calc. for $\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{~F}_{3} \mathrm{NO}_{3}$ : C 42.30, H 5.32, N 6.17; found: C 42.35, H 5.35, N 6.25 .

4,4-Diethyl-2-(trifluoromethyl)oxazol-5(4H)-one (3). A soln. of $2(5.0 \mathrm{~g}, 22.0 \mathrm{mmol}$ ) in thionyl chloride $(50 \mathrm{ml}, 685 \mathrm{mmol})$ was heated at $50^{\circ}$ for 5 h . After removal of $\mathrm{SOCl}_{2}$, the oily residue was distilled under reduced pressure to afford $\mathbf{3}(2.9 \mathrm{~g}, 63 \%)$. Colorless oil. B.p. $83-84^{\circ} / 110$ Torr. IR (neat): 1830. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) ; 1.95(q, J=7.4,4 \mathrm{H}) ; 0.85(t, J=7.4,6 \mathrm{H})$. Compound $\mathbf{3}$ was very sensitive to air, and was easily converted to the acid $\mathbf{2}$.

Diethylglycine Methyl Ester (= Methyl 2-Amino-2-ethylbutanoate; Deg-OMe; 4a). A soln. of 1 (4.0 g, $23.8 \mathrm{mmol})$ and $\mathrm{SOCl}_{2}(6.0 \mathrm{ml}, 82.2 \mathrm{mmol})$ in $\mathrm{MeOH}(120 \mathrm{ml})$ was refluxed for 24 h . After removal of MeOH , the oily residue was diluted with $5 \%$ aq. $\mathrm{NaHCO}_{3}$ soln. and extracted with $\mathrm{CHCl}_{3}$ and the extract dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated: crude $\mathbf{4 a}$ ( $2.3 \mathrm{~g}, 66 \%$ ) which was used in the next reaction without purification. Colorless oil. IR (neat): 3390 (br.), $1725 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 3.72(s, 3 \mathrm{H}) ; 1.80(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.70$ (br. $s, 2 \mathrm{H}) ; 1.56(q d, J=7.4,14.8,2 \mathrm{H}) ; 0.85(t, J=7.4,6 \mathrm{H})$.

Diethylglycine Ethyl Ester ( $=$ Ethyl 2-Amino-2-ethylbutanoate; Deg-OEt; $\mathbf{4 b}$ ). Ester $\mathbf{4 b}$ was prepared from $\mathbf{1}$ as described for $\mathbf{4 a}$ and used without purification. Yield $70 \%$. Colorless oil. IR (neat): 3380 (br.), 1720 . ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 4.18(q, J=6.9,2 \mathrm{H}) ; 1.82(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.56(q d, J=7.4,14.8,2 \mathrm{H})$; $1.28(t, J=6.9,3 \mathrm{H}) ; 0.86(t, J=7.4,3 \mathrm{H})$.

Methyl 2-Ethyl-2-\{\{2-ethyl-1-oxo-2-[ (trifluoroacetyl)aminoJbutyl\}amino\}butanoate $\quad\left(\mathrm{CF}_{3} \mathrm{CO}\right.$-Deg-DegOMe; 5a). A soln. of $\mathbf{3}(1.88 \mathrm{~g}, 8.99 \mathrm{mmol})$ and $\mathbf{4 a}(1.95 \mathrm{~g}, 13.4 \mathrm{mmol})$ in $\mathrm{MeCN}(20 \mathrm{ml})$ was refluxed for 4 days. Evaporation afforded an oily residue which was purified by CC (silica gel, $10 \% \mathrm{AcOEt} / \mathrm{hexane}$ ): $5 \mathbf{5 a}(2.87 \mathrm{~g}$,
$90 \%$ ). Colorless crystals. M.p. $96-97^{\circ}$. IR ( KBr ): $3370,3270,1720,1700,1660 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ : 7.95 (br. $s, 1 \mathrm{H}$ ); 6.76 (br. $s, 1 \mathrm{H}) ; 3.82(s, 3 \mathrm{H}) ; 2.66(q d, J=7.3,14.6,2 \mathrm{H}) ; 2.45(q d, J=7.3,14.6,2 \mathrm{H})$; $1.84(q d, J=7.3,14.6,2 \mathrm{H}) ; 1.72(q d, J=7.3,14.6,2 \mathrm{H}) ; 0.83(t, J=7.3,6 \mathrm{H}) ; 0.76(t, J=7.3,6 \mathrm{H})$. FAB MS: $355.2\left([M+\mathrm{H}]^{+}\right)$. Anal. calc. for $\mathrm{C}_{15} \mathrm{H}_{25} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C 50.84, H 7.11, N 7.91; found: C 50.92, H 7.14, N 7.84.

Ethyl 2-Ethyl-2-\{\{2-ethyl-1-oxo-2-[(trifluoroacetyl)amino]butyl\}amino\}butanoate $\left(\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}-\mathrm{Deg}-\mathrm{OEt}\right.$; $\mathbf{5 b}$ ). As described for 5a, from 3 and 4b: $99 \%$ of 5b. M.p. $81-82^{\circ}$. IR (KBr): 3350, 3250, 1730, 1690, 1660. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) ; 7.96$ (br. $\left.s, 1 \mathrm{H}\right) ; 6.80($ br. $s, 1 \mathrm{H}) ; 4.28(q, J=7.1,2 \mathrm{H}) ; 2.69(q d, J=7.4,14.8$, $2 \mathrm{H}) ; 2.46(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.86(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.75(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.33(t, J=7.1,3 \mathrm{H})$; $0.83(t, J=7.4,6 \mathrm{H}) ; 0.76(t, J=7.4,6 \mathrm{H})$. FAB-MS: $369.2\left([M+\mathrm{H}]^{+}\right)$. Anal. calc. for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{4}: \mathrm{C} 52.17$, H 7.39, N 7.60; found: C 52.05, H 7.37, N 7.45.

2-Ethyl-2-\{\{2-ethyl-1-oxo-2-[(trifluoroacetyl)amino]butyl\}amino\}butanoic Acid ( $\left.\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}-\mathrm{Deg}-\mathrm{OH} 6\right)$. A soln. of $5 \mathbf{5}(615 \mathrm{mg}, 1.74 \mathrm{mmol})$ and $\mathrm{NaOH}(1.00 \mathrm{~g}, 25.0 \mathrm{mmol})$ in dioxane $(7 \mathrm{ml})$ and $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{ml})$ was stirred for 2 days. The mixture was diluted with $\mathrm{H}_{2} \mathrm{O}$ and washed with $\mathrm{CHCl}_{3}$. The aq. soln. was acidified with $10 \%$ aq. HCl soln. and extracted with $\mathrm{CHCl}_{3}$ and the org. phase dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated: $6(350 \mathrm{mg}, 59 \%)$. Colorless crystals. The anal. sample was recrystallized from $\mathrm{CHCl}_{3}$. M.p. $136-137^{\circ}$. $\mathrm{IR}(\mathrm{KBr}): 3380,3300$, 3000 (br.), 1710 (br.), $1670 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): 7.94 (br. $s, 1 \mathrm{H}$ ); 6.63 (br. $s, 1 \mathrm{H}$ ); 6.50 (br. 1 H ); $2.65(q d, J=7.3,14.6,2 \mathrm{H}) ; 2.45(q d, J=7.3,14.6,2 \mathrm{H}) ; 1.90(q d, J=7.3,14.6,2 \mathrm{H}) ; 1.69(q d, J=7.3,14.6$, $2 \mathrm{H}) ; 0.84(t, J=7.3,12 \mathrm{H})$. EI-MS: $341.2\left(2, M^{+}\right), 182(100)$. EI-HR-MS: $340.1626\left(\mathrm{C}_{14} \mathrm{H}_{23} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{4}{ }^{+}, M^{+} ;\right.$calc. 340.1610). Anal. calc. for $\mathrm{C}_{14} \mathrm{H}_{23} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C 49.41, H 6.81, N 8.23; found: C 49.44, H 6.87, N 8.11.

Methyl Trifluoroacetyl-diethylglycyl-diethylglycyl-diethylglycinate $\left(\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}-\mathrm{Deg}\right.$-Deg-OMe; 8a). A mixture of $6(134 \mathrm{mg}, 0.394 \mathrm{mmol})$ and $N$-[3-(dimethylamino)propyl]- $N^{\prime}$-ethylcarbodiimide (EDC) ( 100 mg , $0.522 \mathrm{mmol})$ in $\mathrm{MeCN}(5 \mathrm{ml})$ was stirred at r.t. Amine $\mathbf{4 a}(150 \mathrm{mg}, 1.03 \mathrm{mmol})$ was added to the soln. and the mixture was refluxed for 14 days. After evaoporation, the residue was purified by CC (silica gel). Elution with $15 \% \mathrm{AcOEt} / \mathrm{hexane}$ afforded 7 ( $96 \mathrm{mg}, 75 \%$ ), and elution with $20 \% \mathrm{AcOEt} /$ hexane gave $\mathbf{8 a}$ ( $12.8 \mathrm{mg}, 7 \%$ ).

Data of 7: Colorless oil. IR (neat): 3375, 1835, 1730, 1660. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 7.48$ (br. $s, 1 \mathrm{H}$ ); $2.54(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.80-2.00(m, 6 \mathrm{H}) ; 0.87(t, J=7.4,6 \mathrm{H}) ; 0.83(t, J=7.4,6 \mathrm{H})$. EI-MS: 322.1 (3, $M^{+}$), 294.1(38), 265.1(100), 225.1(24), 182.1(66).

Ethyl Trifluoroacetyl-diethylglycyl-diethylglycyl-diethylglycinate $\left(\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}-\mathrm{Deg}\right.$-Deg-OEt; 8b). $\mathrm{NaBH}_{4}$ $(2.0 \mathrm{~g}, 52.9 \mathrm{mmol})$ was added to the stirred soln. of $\mathbf{5 b}(2.00 \mathrm{~g}, 5.43 \mathrm{mmol})$ in $\mathrm{EtOH}(70 \mathrm{ml})$, and the mixture was refluxed for 2 h . More $\mathrm{NaBH}_{4}(500 \mathrm{mg}, 13.2 \mathrm{mmol})$ was added and the mixture refluxed for 2 h . The mixture was then diluted with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{ml})$ and the EtOH evaporated. The aq. soln. was acidified with $5 \% \mathrm{aq}$. HCl soln. and washed with $\mathrm{Et}_{2} \mathrm{O}$. The soln. was neutralized with $5 \%$ aq. $\mathrm{NaHCO}_{3}$ soln. and extracted with $\mathrm{CHCl}_{3}$, the extract dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated, and the residue $(c a .1 .4 \mathrm{~g})$ dissolved in $\mathrm{MeCN}(30 \mathrm{ml})$. Then $3(1.45 \mathrm{~g}$, 6.93 mmol ) was added and the mixture refluxed for 3 days. Evaporation gave an oily residue which was purified by CC (silica gel, $20 \% \mathrm{AcOEt} / \mathrm{hexane}$ ): $\mathbf{8 b}(1.90 \mathrm{~g}, 73 \%)$. Colorless crystals. M.p. $156-157^{\circ}$ (recryst. from $\mathrm{MeOH} / \mathrm{CHCl}_{3}$ ). IR ( KBr ): 3400, 3350, 3320, $1730,1660 .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ): 8.00 (br. s, 1 H ); 7.41 (br. $s, 1 \mathrm{H}) ; 6.78(\mathrm{br} . ~ s, 1 \mathrm{H}) ; 4.28(q, J=7.3,2 \mathrm{H}) ; 2.55-2.80(m, 4 \mathrm{H}) ; 2.43(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.60-$ $1.95(\mathrm{~m}, 6 \mathrm{H}) ; 1.32(t, J=7.3,3 \mathrm{H}) ; 0.83(t, J=7.4,6 \mathrm{H}) ; 0.77(t, J=7.4,12 \mathrm{H})$. FAB-MS: $504.3\left([M+\mathrm{Na}]^{+}\right)$, $482.3\left([M+\mathrm{H})^{+}\right]$. Anal. calc. for $\mathrm{C}_{22} \mathrm{H}_{38} \mathrm{~F}_{3} \mathrm{~N}_{3} \mathrm{O}_{5}$ : C 54.87, H 7.95, N 8.73 ; found: C 54.94, H 7.94, N 8.73.

Ethyl Trifluoroacetyl-diethylglycyl-diethylglycyl-diethylglycyl-diethylglycinate $\quad\left(\mathrm{CF}_{3} \mathrm{CO}\right.$-Deg-Deg-Deg-Deg-OEt; 9). $\mathrm{NaBH}_{4}(2.0 \mathrm{~g}, 52.9 \mathrm{mmol})$ was added to the stirred soln. of $\mathbf{8 b}(1.80 \mathrm{~g}, 3.74 \mathrm{mmol})$ in EtOH $(100 \mathrm{ml})$, and the mixture was refluxed for 1 h . More $\mathrm{NaBH}_{4}(500 \mathrm{mg}, 13.2 \mathrm{mmol})$ was added and the mixture refluxed for 1 h . The mixture was then diluted with $\mathrm{H}_{2} \mathrm{O}(80 \mathrm{ml})$ and the EtOH evaporated. After workup as described for $\mathbf{8 b}$, the residue, $\mathbf{2}(1.00 \mathrm{~g}, 4.40 \mathrm{mmol})$, and EDC ( $820 \mathrm{mg}, 4.28 \mathrm{mmol}$ ) in MeCN ( 50 ml ) were refluxed for 3 days. After evaporation, the residue was diluted with $\mathrm{CHCl}_{3}$, the soln. washed with $\mathrm{H}_{2} \mathrm{O}$, dried $\left(\mathrm{MgSO}_{4}\right)$, and evaporated, and the oily residue purified by CC (silica gel, $30 \% \mathrm{AcOEt} / \mathrm{hexane}$ ): 9 ( $1.78 \mathrm{~g}, 80 \%$ ). Colorless crystals. M.p. $200.5-201.5^{\circ}$ (recryst. from EtOH). IR (KBr): 3400, 3350, 1720, 1675, 1650. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) ; 8.02$ (br. $s, 1 \mathrm{H}$ ); 7.44 (br. $s, 1 \mathrm{H}$ ); 7.38 (br. $s, 1 \mathrm{H}$ ); 6.77 (br. $\left.s, 1 \mathrm{H}\right) ; 4.28(q, J=6.9,2 \mathrm{H})$; $2.55-2.75(m, 6 \mathrm{H}) ; 2.46(q d, J=7.3, \quad 14.6,2 \mathrm{H}) ; 1.65-1.94(m, 8 \mathrm{H}) ; 1.32(t, J=6.9,3 \mathrm{H}) ; 0.74-0.90$ $(m, 24 \mathrm{H})$. FAB-MS: $617.4\left([M+\mathrm{Na}]^{+}\right)$, $595.4\left([M+\mathrm{H}]^{+}\right)$. Anal. calc. for $\mathrm{C}_{28} \mathrm{H}_{49} \mathrm{~F}_{3} \mathrm{~N}_{4} \mathrm{O}_{6}: \mathrm{C} 56.55$, H 8.31 , N 9.42; found: C 56.66, H 8.35, N 9.39.

Ethyl Trifluoroacetyl-diethylglycyl-diethylglycyl-diethylglycyl-diethylglycyl-diethylglycinate $\left(\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}\right.$ -Deg-Deg-Deg-Deg-OEt; 10). As described for 9, from 9 and 2: 81\%. M.p. 246-247.5 (recryst. from MeOH). IR (KBr): 3350 (br.), 3320 (br.), 3200, 1720, 1700, 1660, 1630. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(270 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ); 8.01 (br. s, 1 H ); 7.45 (br. $s, 1 \mathrm{H}$ ); 7.41 (br. $s, 1 \mathrm{H}$ ); 7.37 (br. $s, 1 \mathrm{H}$ ); 6.77 (br. $s, 1 \mathrm{H}) ; 4.28(q, J=7.0,2 \mathrm{H}) ; 2.50-2.75(\mathrm{~m}, 8 \mathrm{H})$; $2.45(q d, J=7.4,14.8,2 \mathrm{H}) ; 1.55-1.95(m, 10 \mathrm{H}) ; 1.35(t, J=7.0,3 \mathrm{H}) ; 0.74-0.90(m, 30 \mathrm{H})$. FAB-MS: $730.5\left([M+\mathrm{Na}]^{+}\right), 708.5\left([M+\mathrm{H}]^{+}\right)$. Anal. calc. for $\mathrm{C}_{34} \mathrm{H}_{60} \mathrm{~F}_{3} \mathrm{~N}_{5} \mathrm{O}_{7}$ : C 57.69, H 8.54, N 9.89; found: C 57.72, H 8.51, N 9.81.

Ethyl Trifluoroacetyl-diethylglycyl-diethylglycyl-diethylglycyl-diethylglycyl-diethylglycyl-diethylglycinate $\left(\mathrm{CF}_{3} \mathrm{CO}-\mathrm{Deg}-\mathrm{Deg}-\mathrm{Deg}\right.$-Deg-Deg-Deg-OEt; 11). As described for 9 , from 10 and 2. Purification by CC (silica gel, $10 \% \mathrm{MeOH} / \mathrm{CHCl}_{3}$ ) afforded 11 (54\%). Colorless crystals. M.p. $280-282^{\circ}$ (recryst. from MeOH). IR (KBr): 3350 (br.), 3320 (br.), $3225,1710,1660$ (br.). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ); 8.00 (br. s, 1 H ); 7.45 (br. $s, 1 \mathrm{H}) ; 7.42$ (br. $s, 1 \mathrm{H}$ ); 7.40 (br. $s, 1 \mathrm{H}$ ); 7.36 (br. $s, 1 \mathrm{H}$ ); 6.77 (br. $s, 1 \mathrm{H}$ ); $4.27(q, J=7.1,2 \mathrm{H}$ ); $2.57-2.67$ $(m, 10 \mathrm{H}) ; 2.44(q d, J=7.3,14.6,2 \mathrm{H}) ; 1.84(q d, J=7.3,14.6,2 \mathrm{H}) ; 1.65-1.78(m, 10 \mathrm{H}) ; 1.33(t, J=7.1,3 \mathrm{H})$; $0.80-0.88(m, 30 \mathrm{H}) ; 0.77(t, J=7.3,6 \mathrm{H})$. FAB-MS: 843.5 $\left([M+\mathrm{Na}]^{+}\right), 821.5\left(M^{+}\right)$. Anal. calc. for $\mathrm{C}_{40} \mathrm{H}_{71} \mathrm{~F}_{3} \mathrm{~N}_{6} \mathrm{O}_{8}$ : C 58.52, H 8.72, N 10.24 ; found: C 58.55, H 8.78, N 10.18.
$X$-Ray Diffraction. Crystals were grown from MeOH solns. by slow evaporation. Data collection for three peptides was performed on a Rigaku-AFC5R diffractometer, Ni-foil filtered $\mathrm{CuK} \alpha$ radiation. Crystal and collection parameters are listed in Table 3. All three crystals remained stable at r.t. during the X-ray data collection. The structures were solved by direct methods using SIR92 [16] and expanded using Fourier techniques [17]. All non- H -atoms were given anisotropic thermal parameters, and H -atoms included in calculated positions were given isotropic thermal parameters. The final cycle of full-matrix least-squares refinement of tripeptide 8a gave a conventional $R$ factor of $0.070(R w=0.059)$ based on $1913(I>3.0 \sigma(I))$ reflections, and the largest peak and hole in the final difference Fourier map were 0.20 and $-0.17 \mathrm{e} \cdot \AA^{-3}$. Two independent molecules ( $\mathbf{A}$ and $\mathbf{B}$ ) existed in the asymmetric unit of the pentapeptide $\mathbf{1 0}$. Rotational disorders typical of the trifluoroacetyl functions were observed in both molecules $\mathbf{A}$ and $\mathbf{B}$. The $C(\gamma)$ atoms of the Deg-3 side chain in molecule $\mathbf{A}$ were disordered over two sites with the occupancy factors 0.58 and 0.42 for the major and minor component, resp. In the $C(\beta)$ atoms of the ethyl ester moiety at the C-terminal protecting group of peptide $\mathbf{A}$, the disorders were also observed. Their occupancy factors were refined to values of 0.68 and 0.32 , resp. The $R$ factor was $0.061(R w=0.061)$ for 5134 data $(I>3.0 \sigma(I))$, and the largest peak and hole in the final difference Fourier map were 0.24 and $-0.30 \mathrm{e} \cdot \AA^{-3}$. For the hexapeptide 11, the $R$ factor was 0.067 ( $R w=0.062$ ) for 2721 data $(I>2.5 \sigma(I))$, and the largest peak and hole in the final difference Fourier map were 0.31 and $-0.24 \mathrm{e} \cdot \AA^{-3}$. All calculations were performed using the teXsan [18] crystallographic package of Molecular Structure Corporation.

Crystallographic data (excluding structure factors) for the structures reported in this paper have been deposited with the Cambridge Crystallographic Data Centre as deposition No. CCDC-113401, 113402, and 113403. Copies of the data can be obtained, free of charge, on application to the CCDC, 12 Union Road, Cambridge CB21EZ, UK. (fax: + 44 (1223) 336 033; e-mail: deposit@ccdc.cam.ac.uk).

Molecular-Mechanics Calculation. Conformational-energy calculations were performed by using the package of MacroModel Ver. 5.5 [19]. The parameters used were as follows: conformational search, Monte Carlo method; force field, AMBER*, 2000 structures were minimized; solvent, water.

This work was partly supported by a Grant-in-Aid for Encouragement of Young Scientists from the Ministry of Education, Science, and Culture of Japan. We thank Mr. Yoshitsugu Tanaka and Ms. Yasuko Soeda for the measurement of ${ }^{1} \mathrm{H}$-NMR spectra at low temperature. We also thank Dr. Max Dobler, ETH, Zürich, for kindly providing the MacMoMo nfp program for viewing of the results of X-ray analysis.
