A new polyketide metabolite, the twelve-membered macrolide $\mathbf{1}$, isolated from the endophytic fungal strain *Cladosporium tenuissimum* LR 463 of *Maytenus hookeri*, whose structure had been determined as (6*R*,12*S*)-6-hydroxy-12-methyl-1-oxacyclododecane-2,5-dione, was synthesized for the first time by a convergent strategy *via Yamaguchi* esterification of $\mathbf{2}$ with $\mathbf{3}$ and ring-closing metathesis (RCM) to afford the cyclic ester $\mathbf{1}$ that was eventually transformed to the target molecule. However, the total synthesis revealed that the assigned structure of the natural product is not correct.

Introduction. – Endophytic fungi constitute an important source of biologically active chemical compounds with significant pharmacological activity, which can be further employed as lead compounds. *Colletotrichum magna*, a non-pathogenic endophytic fungus, on inoculation of watermelon and cucumber seedlings, rapidly induces systematic defense responses which include the production of peroxidase, phenylalanine ammonia-lyase, lignin, and salicylic acid. A hexaketide lactone **1** was isolated [1] along with the known cladospolides (cladospolides A and B, and isocladospolide B) from the fermented strain *Cladosporium tenuissimum* LR 463 of *Maytenus hookeri*. As part of our interest in the synthesis of bioactive natural products [2], here we report the synthesis of **1** (*Fig.*) by a convergent strategy. Structurally, this natural product bears close resemblance to cladospolides [3]. Our strategy involves the esterification of the respective acid component and alcohol moiety under *Yamaguchi* conditions, followed by the *Grubbs*' catalyst-mediated ring-closing metathesis (RCM) to afford the cyclic ester. The cyclic ester was transformed to the target macrolide.

Interesting structural features coupled with the biological activity of the isolated natural product has attracted us to embark on its first total synthesis. Here, we report our synthetic efforts *en route* to 1 achieved through the respective key intermediates 2 and 3 (*Scheme 1*).

Scheme 1. Retrosynthetic Scheme

As depicted in *Scheme 2*, the synthesis of fragment **2** was initiated with the preparation of **9** [4] from D-mannitol. Then, the corresponding primary alcohol was generated by hydroboration of **9** with cyclohexene, $BH_3 \cdot Me_2S$, THF at 0° in 87% yield, followed by its conversion into *para*-methoxybenzyl (PMB)-ether with PMB-Br and NaH in THF at 0° to afford **10** in 85% yield. Diol **11** was formed from **10** by the deprotection of the acetal group with 60% aqueous AcOH at room temperature in 70% yield. The primary OH group of the diol **11** was protected with Ts group (TsCl/Et₃N/CH₂Cl₂/0°/room temperature, 72%), leading to oxirane **12** (69%) upon treatment with K₂CO₃ in MeOH.

Scheme 2. Synthesis of Fragment 2

a) See [4]. b) 1. BH₃·Me₂S, cyclohexene/THF, 0° to r.t., 3 h; 2. NaOH, 30% H₂O₂, 2 h; 87%; 3. PMB-Br (= *para*-methoxybenzyl bromide), NaH, THF, 0°, 6 h; 85%. c) 60% AcOH, r.t., 12 h; 70%. d) 1. Et₃N, TsCl, CH₂Cl₂, 0° to r.t., 4 h; 72%; 2. K₂CO₃/MeOH, r.t., 1 h; 69%. e) CuI, VinylMgBr, THF, -20° , 1 h; 87%. f) 1. ('Bu)Ph₂SiCl (TBDPS-Cl), 1*H*-imidazole, CH₂Cl₂, 0° to r.t., 12 h, 92%; 2. 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ), CH₂Cl₂/H₂O, 19:1; 87%. g) 1. (COCl)₂/DMSO, Et₃N, CH₂Cl₂, -78° , 1 h; 89%; 2. NaClO₂, NaH₂PO₄·2 H₂O, 'BuOH, 2-methylbut-2-ene, 0° to r.t., 2 h; 79%.

Ring-opening reaction of oxirane **12** with vinylmagnesium bromide [5] in the presence of CuI in THF at -20° gave homoallylic alcohol **13** (87%). Silyl protection of **13** (('Bu)Ph₂SiCl (TBDPS-Cl)/1*H*-imidazole/CH₂Cl₂; 92%), followed by the removal of the PMB group under conventional conditions (DDQ in CH₂Cl₂/H₂O, 19:1) furnished **14** in 87% yield. Oxidation of the latter to the corresponding aldehyde (89%) under *Swern* conditions, followed by a second oxidation [6] with NaClO₂, NaH₂PO₄. 2 H₂O in *t*-BuOH and 2-methylbut-2-ene gave the acid **2** (79%). As outlined in *Scheme 3*, the coupling of the two fragments **2** and (2*S*)-hex-5-en-2-ol (**3**; commercially available) *via Yamaguchi* esterification [7] (Et₃N/2,4,6-trichlorobenzoyl chloride/DMAP/THF/0°) gave **4** (69%). Subsequently, the *Grubbs*' catalyst [8] mediated RCM (G-II/CH₂Cl₂/reflux) of compound **4** afforded the cyclic ester **5** (80%) as (*E*)/(*Z*)-mixture in a ratio of 34:66. However, no efforts were made to separate the geometrical isomers, since the presence of the mixture bears little relevance in the latter part of the synthesis.

Scheme 3. Synthesis of the Target Compound 1

a) 1. 2,4,6-Trichlorobenzoyl chloride, Et₃N, THF, 0° to r.t., 4 h; 2. 4-(dimethylamino)pyridine (DMAP), toluene, 0° to r.t., 2 h; 69%. b) Grubbs-II, CH₂Cl₂, reflux, 5 h; 80%. c) H₂, Pd/C, MeOH, r.t., 12 h; 84%. d) Dess–Martin periodinane, CH₂Cl₂, 0° to r.t., 2 h; 89%. e) HF-pyridine/THF, r.t., 12 h; 86%.

Hence, removal of the Bn group as well as the hydrogenation of the C=C bond (10% Pd-C/H₂/r.t.) was carried out in one-pot to produce **6** (84%). Hydroxy compound **6** was then oxidized using *Dess-Martin* periodinane [9] at 0° to give **7** (89%), and subsequent removal of the TBDPS group by HF-pyridine in THF afforded compound **1** (86%; white solid, m.p. 119–121°; $[\alpha]_D^{19} = +37.2$ (c = 0.3, MeOH; [1]: $[\alpha]_D^{19} = -39.5$ (c = 0.57, MeOH)). However, the spectroscopic data of **1** (¹H- and ¹³C-NMR) differed from the reported data of the natural product, and, in addition, the optical rotation value ($[\alpha]_D^{19}$) of the synthetic sample **1** shows the opposite sign of rotation than the reported value. Therefore, the structure of macrolide **1** was erroneously assigned and hence a structural revision is needed for the natural product.

In summary, the stereoselective total synthesis of the twelve-membered macrolide natural product was attempted by a convergent strategy wherein oxirane ring-opening reaction, *Yamaguchi* esterification, and ring-closing metathesis were the key steps. The mismatched spectroscopic data revealed that the structure was erroneously assigned, and hence structural revision was necessary.

Experimental Part

General. Reactions were carried out under N₂ in anh. solvents such as CH₂Cl₂ and THF. All reactions were monitored by TLC (silica-coated plates; visualizing with α -napthol charring). Org. solns. were dried (Na₂SO₄) and concentrated below 40° under reduced pressure in a *Büchi* rotary evaporator. All column chromatographic (CC) separations were performed using silica gel (SiO₂; *Acme*'s, 60–120 mesh) with AcOEt and hexane as eluents. TLC was performed on *Merck 60 F*₂₅₄ silica gel plates. Yields refer to chromatographically and spectroscopically (¹H- and ¹³C-NMR) homogeneous material. Air-sensitive reagents were transferred by syringe and double-ended needle. Optical rotations: *JASCO P-1020* instrument; [α]_D values in units of 10⁻¹ deg cm² g⁻¹ at 25°. IR Spectra: *Perkin-Elmer IR-683* spectrophotometer with NaCl optics. ¹H- and ¹³C-NMR: *Varian Gemini 200 MHz*, *Bruker Avance-300 MHz*, Unity 400 MHz, and Inova 500 MHz for ¹H, and Varian Gemini FT-200 MHz and Bruker Avance 300 MHz spectrometers for ¹³C at 50 MHz and 75 MHz, resp., with 7–10 mM solns. in CDCl₃, TMS as internal standard; J values are given in Hz. MS: *Finnigan Mat 1210* double focusing mass spectrometer.

4-O-*Benzyl*-5,6-O-(*cyclohexane-1,1-diyl*)-2,3-*dideoxy-1*-O-(4-*methoxybenzyl*)-D-erythro-*hexitol* (10). To a stirred soln. of cyclohexene (2.65 g, 32.5 mmol) in dry THF (20 ml), BH₃·Me₂S (1.45 ml, 16.2 mmol) was added at 0°, and the mixture was stirred for 2 h to form a white solid. Then, compound 9 (1.64 g, 5.4 mmol) in dry THF (10 ml) was added at 0°, and then the mixture was stirred for 3 h. Afterwards, MeOH (1.2 ml, 27.08 mmol) was added to the mixture, followed by the addition of 2N NaOH (16.7 ml), 30% H₂O₂ (4.9 ml), and then stirred for 2 h. The mixture was diluted with AcOEt (50 ml). The org. layer was washed with H₂O (2 × 20 ml) and brine (20 ml). The combined org. layers were dried (Na₂SO₄), evaporated *in vacuo*, and purified by CC (SiO₂, 60–120 mesh; 22% AcOEt/hexane) to afford a yellow oil (1.51 g, 87%).

This yellow oil (1.48 g, 4.6 mmol) in dry THF (10 ml) was added to a suspension of NaH (0.28 g, 6.9 mmol) in THF (3 ml) under N₂ at 0°, and the mixture was stirred for 30 min. To this, a soln. of PMB-Br (1.10 g, 5.54 mmol) in dry THF (5 ml) was added, and the mixture was stirred for 6 h at r.t. The reaction was quenched with sat. aq. NH₄Cl soln. (5 ml), and the mixture was extracted with AcOEt (2 × 30 ml). The org. layer was washed with H₂O (2 × 30 ml) and brine (30 ml). The combined org. layers were dried (Na₂SO₄), evaporated *in vacuo*, and purified by CC (SiO₂, 60–120 mesh; 10% AcOEt/ hexane) to afford **10** (1.73 g, 85%).
