The total synthesis of crassalactone A (**1**) has been achieved in twelve steps starting from commercially available 1,5-D-gluconolactone. *Still–Gennari* olefination, one-pot deprotection, and lactonization are the key reactions involved in the synthesis.

**Introduction.** – Styryl lactones isolated from *Polyalthia* species have been used as a traditional medicine. The compounds from this species possess antimalarial [1], anti-inflammatory [2], antimicrobial [3], anti-HIV [4], and cytotoxic activities [5]. Among the styryl lactones crassalactone A (**1**), howiinol A (**2**), and tricinnamate (**3**) share the same core skeleton (*Fig.*). Recently, **1** was isolated from a cytotoxic AcOEt extract of the leaves and twigs of *Polyalthia crassa* by *Tuchinda et al.* [6]. Crassalactone A (**1**) exhibited excellent cytotoxic activities against murine lymphocytic leukemia (P-388;  $ED_{50}$  0.18  $\mu\text{g/ml}$ ), human nasopharyngeal carcinoma (KB; 1.7  $\mu\text{g/ml}$ ), human colon cancer (Col-2; 1.9  $\mu\text{g/ml}$ ), human breast cancer (BCA-1; 0.92  $\mu\text{g/ml}$ ), human lung cancer (Lu-1; 1.9  $\mu\text{g/ml}$ ), and rat glioma (ASK; 1.6  $\mu\text{g/ml}$ ). These excellent biological activities have encouraged us to attempt at the total synthesis of crassalactone A (**1**) and its analogs, and to investigate for further pharmacological properties. So far, there is only one total synthesis reported for crassalactone A [7].

Fig. 1. Structures of some styryl-containing lactones

As part of our ongoing research program on synthesis of biologically active lactone-containing natural products [8], herein, we report the total synthesis of crassalactone A (**1**) starting from commercially available 1,5-D-gluconolactone in which all four contiguous stereogenic centers are present as required for **1**.

**Results and Discussion.** – Retrosynthetically, we envisioned crassalactone A (**1**) to be synthesized from intermediate **4** through one-pot acetonide deprotection and lactonization, **4**, in turn, could be obtained from **5** *via* MOM protection, desilylation,

cinnamoylation, debenzylation, oxidation, and *Still–Gennari* olefination reaction. The key precursor **5** could be obtained from commercially available 1,5-D-gluconolactone in five steps (*Scheme 1*).

Scheme 1. Retrosynthetic Analysis of Crassalactone A (**1**)

The synthesis started from the commercially available, inexpensive 1,5-D-gluconolactone, which was converted to diol **6**, in 65% overall yield, as described in [9]. The primary OH group was selectively protected as the corresponding benzyl ether **7** by using dibutyltin oxide ( $\text{Bu}_2\text{SnO}$ ), benzyl bromide ( $\text{BnBr}$ ), and  $\text{Bu}_4\text{NI}$ . The free secondary OH group was masked as the silyl ether **8** by treatment of **7** with  $t\text{Bu}(\text{Ph})_2\text{SiCl}$  chloride in the presence of  $\text{NaH}$  (*Scheme 2*).

Compound **8** was subjected to ‘dehomologation’ by one-pot primary acetonide deprotection and degradation of the resulting diol with  $\text{H}_3\text{IO}_6$  in  $\text{AcOEt}$  [10] to furnish the aldehyde, which was further subjected to *Grignard* reaction with  $\text{PhMgBr}$  (*in situ* prepared from  $\text{PhBr}$  and  $\text{Mg}$ ) to afford an easily separable (column chromatography) diastereoisomer mixture **5/5a** (in a ratio of 8:2). The desired major product **5** was treated with methoxymethyl chloride ( $\text{MOMCl}$ ) in the presence of *Hünig’s* base to obtain the corresponding methoxymethyl ether **9** in 85% yield. With all the stereogenic centers fixed, the stage was set to proceed further for cinnamoylation and lactone-ring formation. For this purpose, we proceeded with silyl deprotection of **9** to yield the alcohol **10**, which was coupled to cinnamic acid according to standard protocol to yield ester **11** in 85% yield (*Scheme 3*). Debzoylation with DDQ afforded primary alcohol as the precursor for  $\text{C}_2$  homologation reaction and lactonization. Thus, the alcohol **12** was oxidized with 2-iodoxybenzoic acid ( $\text{IBX}$ ) in  $\text{DMSO}$  to afford the corresponding aldehyde, which was subjected to *cis*-selective *Still–Gennari* olefination reaction with bis(2,2,2-trifluoroethyl) [(methoxycarbonyl)methyl]phosphonate in the presence of  $\text{NaH}$  to yield the (*Z*)- $\alpha,\beta$ -unsaturated ester **4** exclusively in 85% yield [11]. the lactone, we performed an acid-catalyzed one-pot deprotection and cyclization reaction. Thus, compound **4** was treated with  $\text{CF}_3\text{COOH}$  (TFA) in  $\text{CH}_2\text{Cl}_2/\text{H}_2\text{O}$  to give the desired product crassalactone **A** (**1**) in 65% yield (*Scheme 3*). The spectroscopic and physical properties of our synthetic compound **1** were in good agreement with the those in the literature [6][7].

**Conclusions.** – In summary, we have demonstrated an efficient synthetic route for the total synthesis of crassalactone **A**. The key steps involved in this synthesis are *Still–Gennari* olefination, one-pot deprotection, and lactonization. The total synthesis has been achieved in twelve steps with 8.09% overall yield.

### Experimental Part

*General.* All reagents were reagent grade and used without further purification, unless specified otherwise. Solvents were distilled prior to use: THF, toluene and  $\text{Et}_2\text{O}$  were distilled from Na and benzophenone ketyl; MeOH from Mg and  $\text{I}_2$ , and  $\text{CH}_2\text{Cl}_2$  from  $\text{CaH}_2$ . All air- or moisture-sensitive reactions were conducted under  $\text{N}_2$  or Ar in flame-dried or oven-dried glassware with magnetic stirring. Column chromatography (CC): silica gel ( $\text{SiO}_2$ ; 60–120 mesh or 100–200 mesh) packed in glass columns; technical-grade AcOEt and petroleum ether (PE), distilled prior to use. Optical rotations: digital polarimeter *Jasco DIP-360*, using a 1-ml cell with a 1-dm path length. FT-IR Spectra: on a *PerkinElmer 683 spectrometer* in KBr pellets  $\text{CHCl}_3/\text{neat}$  (as mentioned);  $\tilde{\nu}$  in  $\text{cm}^{-1}$ .  $^1\text{H}$ - and  $^{13}\text{C}$ -NMR spectra: in  $\text{CDCl}_3$  or  $\text{C}_6\text{D}_6$ , with 200 or 300-MHz, or 500-MHz spectrometer *Bruker 300* or *Varian Unity 500*, resp., at r.t.; coupling constant  $J$  in Hz; the chemical shifts in ppm with TMS as internal standard. ESI-MS and HR-ESI-MS: *Finnigan MAT* instrument.

DDQ (7.4 g, 33.0 mmol) was added to a stirred soln. of **11** (8.8 g, 16.5 mmol) in  $\text{CH}_2\text{Cl}_2$  (90 ml) and  $\text{H}_2\text{O}$  (10 ml) at 0°. The mixture was stirred for 12 h at r.t., and the reaction was quenched by the addition of 10 ml of sat.  $\text{NaHCO}_3$ . The layers were separated, and the aq. layer was extracted twice with  $\text{CH}_2\text{Cl}_2$  ( $3 \times 30 \text{ ml}$ ). The combined org. extracts were dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated *in vacuo*. The crude product was purified by CC ( $\text{SiO}_2$ ; PE/AcOEt 8:2) to give **12** (5.25 g, 72%). Methyl (2*E*)-4-[(4*R*,5*R*)-5-[(*R*)-(Methoxymethoxy)(phenyl)methyl]-2,2-dimethyl-1,3-dioxolan-4-yl]-4-[(2*E*)-3-phenylprop-2-enoyl]oxybut-2-enoate (**4**). IBX (0.70 g, 2.26 mmol) and DMSO (2 ml) were added to a stirred soln. of **12** (0.5 g, 1.13 mmol) in anhyd.  $\text{CH}_2\text{Cl}_2$  (7 ml) under  $\text{N}_2$  at r.t., and stirred for 4 h. After completion of the reaction, the mixture was diluted with  $\text{Et}_2\text{O}$  (15 ml) and filtered through a pad of *Celite*, and the filtrate was washed with sat.  $\text{NaHCO}_3$  (20 ml). The combined org. layers were dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated under vacuum. The crude aldehyde formed was immediately used for the further reaction without purification.

In a 50-ml round-bottom flask, NaH (0.068 g, 1.70 mmol) was taken in 4 ml of dry THF under  $\text{N}_2$ . After 5 min, bis(2,2,2-trifluoroethyl) [(methoxycarbonyl)methyl]phosphonate (0.54 ml, 1.70 mmol) was added at 0°, and the mixture was stirred for 30 min. The mixture was cooled to  $-78^\circ$ , and the aldehyde (0.50 g, 1.13 mmol) in dry THF (5 ml) was added during 10 min, and the resulting mixture was stirred for 1 h at  $-78^\circ$ . The reaction was quenched with sat.  $\text{NH}_4\text{Cl}$  (5 ml), and the mixture was extracted with AcOEt (10 ml). The combined org. layers were concentrated under reduced pressure to give a residue, which was purified by CC ( $\text{SiO}_2$ ; PE/AcOEt 9:1) to furnish **4** (0.476 g, 85%).
