 machi, Kanazawa 920, Japan

**Abstract** — (±)-Canadaline was synthesized using a regio-  
 selective N-C<sub>8</sub> bond cleavage of tetrahydroberberine with ethyl  
 chloroformate.

Canadaline (1),<sup>1</sup> an alkaloid isolated from *Hydrastis canadensis* L, is representa-  
 tive of a new group of isoquinoline alkaloids, the secoberbines.<sup>2</sup> In 1978, Shamma  
et al.<sup>2</sup> reported the first synthesis of its racemate from the Hofmann degradation  
 product (2)<sup>3</sup> of 8-benzyltetrahydroberberine. We now wish to report an alternative  
 and convenient synthesis of (±)-canadaline via a regioselective N-C<sub>8</sub> bond cleavage  
 of tetrahydroberberine itself.

In boiling ethyl chloroformate, tetrahydroberberine (3) gave the urethane (4) in  
 81% yield as a sole product,<sup>4</sup> while the Hofmann degradation<sup>5</sup> or the von Braun  
 reaction<sup>6</sup> of tetrahydroberberine has been found to result in the N-C<sub>6</sub> and/or N-C<sub>14</sub>  
 bond fission. Structure of 4 was confirmed by its conversion to 5 [with LiAlH<sub>4</sub>,  
 66%, δ 2.02 (3H, s), 2.46 (3H, s)]. Treatment of 4 with silver nitrate in aqueous  
 acetone afforded 6 in 66% yield and subsequent lithium aluminum hydride reduction  
 of 6 gave the amino alcohol (8) in 80% yield. The alcohol (8) was also obtained  
 by solvolysis of 4 with acetic acid-sodium acetate followed by lithium aluminum  
 hydride reduction (via 7) in a rather low yield (overall 31%). PCC oxidation<sup>7</sup> of  
 8 furnished (±)-canadaline (1) [68%, mp 143-143.5°, m/e 369 (M<sup>+</sup>), ν (CHCl<sub>3</sub>) 1680  
 cm<sup>-1</sup>, δ (CDCl<sub>3</sub>) 10.20 (1H, s, CHO), 6.86 and 6.68 (2H, AB-q, J=8, C<sub>5</sub>- and C<sub>6</sub>-H),  
 6.40 (2H, s, C<sub>5</sub>- and C<sub>8</sub>-H), 5.76 (2H, s, OCH<sub>2</sub>O), 3.86 (3H, s, OCH<sub>3</sub>), 3.82 (3H, s,  
 OCH<sub>3</sub>), 2.32 (3H, s, NCH<sub>3</sub>), λ<sub>max</sub><sup>MeOH</sup> 288 nm (log ε=3.85)].

The synthetic (±)-canadaline was proved to be completely identical with natural  
 canadaline<sup>1</sup> by <sup>1</sup>H-NMR spectral comparison.

4. The product showed two spots on TLC and exhibited a complex <sup>1</sup>H-NMR spectrum. This phenomenon could be attributed to the presence of two rotamers, because both isolated components gave the same reduction product ( $\overset{5}{\curvearrowright}$ ) in excellent yields.
