Abstract — Ring transformation of the 3-quinoxaliny1-1,5-benzodiazepine hydrochloride (2) gave novel 3-(benzimidazol-2-ylmethylene)-2-oxo-1,2,3,4-tetrahydroquinoxaline hydrochloride (3a), whose treatment with 5% NaOH afforded the free base (4a). Compounds 3a and 4a were converted into the 2,3-fused quinoxalines (6 and 8) via the oxime (5) and ketone (7), respectively.

In a previous paper,¹ we reported a ring transformation of 3-(N,N-dimethylcarbamoyl)-furo[2,3-b]quinoxaline hydrochloride (1) into the 3-quinoxaliny1-1,5-benzodiazepine hydrochloride (2) (Scheme 1). Some 1,5-benzodiazepines have been transformed into

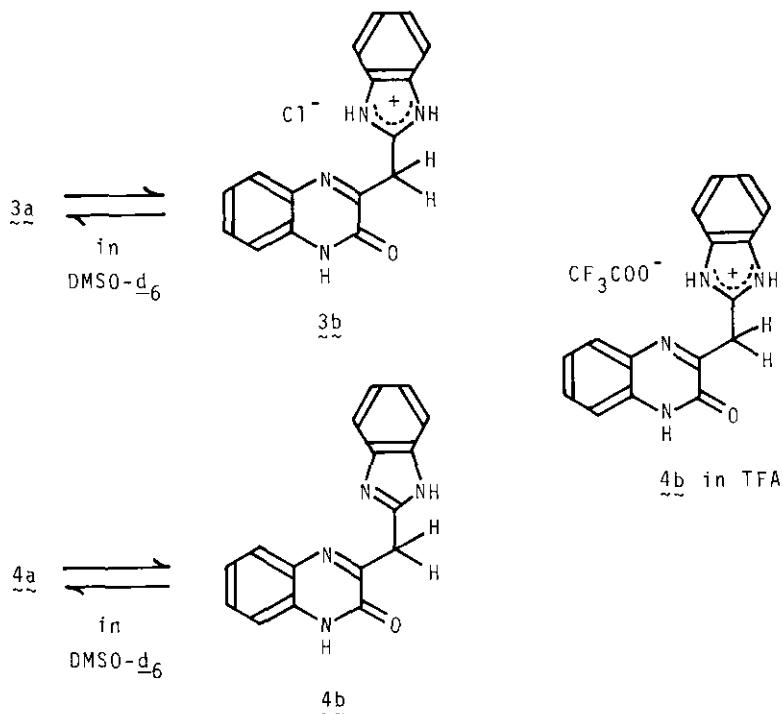

SCHEME 1

benzimidazoles under acidic conditions,² and hence the 1,5-benzodiazepine ring of 2 is expected to be converted into the benzimidazole ring. This successful ring

SCHEME 2

transformation would enable us to produce a new heterocyclic ring system. Thus, the ring transformation of $\tilde{2}$ provided novel 3-(benzimidazol-2-ylmethylene)-2-oxo-1,2,3,4-tetrahydroquinoxaline. In addition, this compound was found to be a key intermediate leading to novel 2,3-fused quinoxalines. This paper describes the conversion of the 3-quinoxalinyl-1,5-benzodiazepine into the 2,3-condensed quino-

xalines ($\sim 6, 8$).

Refluxing of ~ 2 (8 g) in H_2O (80 ml)/AcOH (300 ml) for 2 h gave 3-(benzimidazol-2-ylmethylene)-2-oxo-1,2,3,4-tetrahydroquinoxaline hydrochloride ($\sim 3a$) (6.88 g, 94 %).³ Treatment of $\sim 3a$ (5 g) with 5% NaOH afforded the free base ($\sim 4a$) (4.58 g, 93 %).⁴ These results are shown in Scheme 2, including a postulated reaction mechanism. Structural assignments of $\sim 3a$ and $\sim 4a$ were based on the analytical and spectral data. The NMR spectra of $\sim 3a$ and $\sim 4a$ in DMSO-d_6 exhibited the vinyl [δ 6.41 ($\sim 3a$) and 6.24 ($\sim 4a$) ppm] and methylene [δ 4.78 ($\sim 3a$) and 4.55 ($\sim 4a$) ppm] proton signals, whose values were similar to those of the other 3-heteroarylalkylene-2-oxo-1,2,3,4-tetrahydroquinoxalines previously synthesized by us [vinyl (δ 6.42-5.87 ppm), methylene (δ 4.56-4.18 ppm)].⁵⁻⁸ These data indicate the coexistence of two tautomers $\sim a$ and $\sim b$ in DMSO-d_6 (Scheme 3, Table I).⁵⁻⁸ Moreover, the spectra of $\sim 3a$

and $\underline{4a}$ in trifluoroacetic acid (TFA) represented the methylene proton signals at δ 5.21 and 5.12 ppm due to the tautomers $\underline{3b}$ and $\underline{4b}$, respectively, without the vinyl proton signals.⁵⁻⁸

The reaction of $\underline{3a}$ (4 g, 12.8 mmol) with NaNO_2 (1.33 g, 19.2 mmol) in H_2O (40 ml)/
 AcOH (120 ml) resulted in hydroxyimination^{6,7} to provide 3-(α -hydroxyimino-benzimidazol-2-ylmethyl)-2-oxo-1,2-dihydroquinoxaline ($\underline{5}$) (3.78 g, 91%).⁹ Refluxing of
 $\underline{5}$ (1 g) in POCl_3 (10 ml)/dioxane (10 ml) effected dehydrative cyclization to fur-
nish 3-(benzimidazol-2-yl)isoxazolo[4,5-b]quinoxaline ($\underline{6}$) (0.90 g, 96%).¹⁰ On the
other hand, oxidation of $\underline{4a}$ (5 g) with m -chloroperbenzoic acid (MCPBA) (2 eq.) in
 EtOH (300 ml)^{5a,6,7} produced 3-(benzimidazol-2-ylcarbonyl)-2-oxo-1,2-dihydroquino-
xaline ($\underline{7}$) (2.71 g, 49%).¹¹ Refluxing of $\underline{7}$ (700 mg, 2.27 mmol) and \underline{o} -phenylenedi-
amine ($\underline{o$ -PD) dihydrochloride (960 mg, 3.41 mmol) in AcOH (50 ml) followed by treat-
ment with 10% NaOH afforded 12-(benzimidazol-2-yl)-6H-quinoxalino[2,3-b][1,5]benzo-
diazepine ($\underline{8}$) (250 mg, 27%).¹²

 13. Because of the tautomerism, the integral curves of the NH, vinyl, and methylene proton signals are unsatisfactorily observed.
