Aza[15] annulenes  $(\underline{4})$ ,  $(\underline{8})$ ,  $(\underline{10})$  were prepared via the thermolysis of the vinyl monoazido  $(\underline{1})$  and vinyl diazide  $(\underline{5})$ .

The tautomerization of (3) into (4) could be monited by  ${}^{1}$ H n.m.r. spectroscopy (in d<sub>8</sub>-toluene at 75°).

The thermolysis of vinyl diazide (5) led to (7), as an isolabable reaction intermediate, from which 3-methoxy aza[15]annulene (10), 3-keto aza[15]annulene (8), and aza[15]annulene (4) were derived (Scheme 2).

Scheme 2

As expected, aza[15]annulenes (4) and (10) were proved to be strongly paratropic (16x), exhibiting NH proton at very low field, and outer olefinic protons at high field.
