SYNTHESES OF WASABI PHYTOALEXIN (METHYL 1-METHOXYINDOLE-3-CARBOXYLATE) AND ITS 5-IODO DERIVATIVE, AND THEIR NUCLEOPHILIC SUBSTITUTION REACTIONS $^{\rm 1}$

Masanori Somei,* Asuka Tanimoto, Hitomi Orita, Fumio Yamada, and Toshiharu Ohta Faculty of Pharmaceutical Sciences, Kanazawa University, 13-1 Takara-machi, Kanazawa 920-0934, Japan

Abstract — A simple synthetic method for methyl 1-methoxyindole-3-carboxylate, a phytoalexin isolated from *Wasabia japonica*, syn. *Eutrema wasabi*, and its 5-iodo derivative is reported. They underwent nucleophilic substitution reactions selectively at the 2-position.

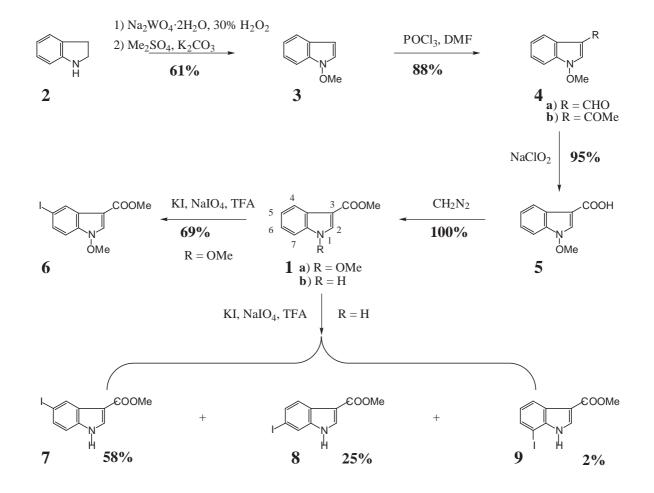

Soledade and co-workers² isolated methyl 1-methoxyindole-3-carboxylate³ (**1a**) from Wasabi (*Wasabia japonica*, syn. *Eutrema wasabi* as a phytoalexin (Scheme 1). They determined its structure by direct comparison with the authentic sample, obtained in 6% overall yield from indoline (**2**) in six steps without characterizing any intermediates at all. In the synthesis, our synthetic method for 1-methoxyindole (**3**) from **2** with NaWO₄·2H₂O and 30% H₂O₂⁴ was applied as a key step.² The compound (**1a**) itself had already been synthesized by Acheson and co-workers³ in ten steps from *o*-nitroaniline in poor overall yield.

We have disclosed that 1-methoxyindoles having electron withdrawing group such as formyl $(4a)^{3,5}$ and acetyl⁶ (4b) at the 3-position readily undergo nucleophilic substitution reactions⁷ regioselectively at the 2-position. Therefore, we have been much interested in 1a and 4a,b for determining whether their reactivities are correlated with antifungal activities or not. In this report, we wish to describe an effective and simple syntheses of 1a, 1-methoxyindole-3-carboxylic acid (5), and 5-iodo derivative (6), as well as their nucleophilic substitution reactions comparing with those of 4a,b.

First, we have succeeded in the synthesis of **1a** from **2** in only five steps with 51% overall yield. Thus, according to our previous report,⁴ 1-methoxyindole-3-carbaldehyde (**4a**), a phytoalexin found by Takasugi^{8a} and co-workers from plant family *Cruciferae*, was prepared in three steps with 54% overall yield from **2**. Further oxidation of **4a** with NaClO₂⁹ was successful to give 95% yield of **5** as stable colorless prisms melting at 173—174°C. These physical data are different from the reported off-white powder melting at 164—165°C (decomp) by Acheson and co-workers.³ Subsequent methylation of **5** with CH₂N₂ provided a quantitative yield of **1a** as stable colorless prisms, mp 45—46°C. These data are not consistent with the reported pink prisms,³ mp 39—40°C, either. These facts show that pure **1a** and **5** are now produced for the first time.

We next examined iodination of **1a** with KI and $NaIO_4^{10}$ in TFA-H₂O. It is interesting to note that the desired methyl 5-iodo-1-methoxyindole-3-carboxylate (6) was produced predominantly in 69% yield,

Scheme 1

while under similar reaction conditions the iodination of methyl indole-3-carboxylate (1b) gave 5-iodo-(7), 6-iodo-(8), and 7-iodo compound (9) in 58, 25, and 2% yields, respectively. The results suggest that the introduction of 1-methoxy group would be an useful means for realizing regioselective electrophilic substitution reactions at the 5-position.

The structure of **6** was proved by comparing its ¹H-NMR spectrum with that of **1a**. The multiplet C(4)– proton of **1a**, readily discernible in the spectrum because of resonating at the lowest field among other proton signals due to the anisotropy effect of the methoxycarbonyl moiety, changed to *meta*-coupled doublet (J = 2 Hz) in the spectrum of **6**, proving it to be 5-substituted compound. Similar results were observed in the case of **7**. In the spectrum of **8**, the C(4)–proton is an *ortho-* and *para*-coupled double doublets (J = 8 and 0.5 Hz) showing it to be 6-substituted compound. The compound (**9**) is shown to be 7-substituted indole because the C(4)–proton appears as an *ortho-* and *meta*-coupled doublet (J = 8 and 1 Hz).

With **1a** and **6** in hand, their nucleophilic substitution reactions were examined. The reaction of **1a** with excess 15% aqueous NaSMe produced methyl 2-methylthioindole-3-carboxylate (**10**) and **5**, and the results are summarized in Table 1. Throughout these experiments, formation of 2-methylthioindole-3-carboxylic acid (**11**) was not observed. These facts indicate that once **5** is formed, it does not undergo nucleophilic substitution reaction, in addition hydrolysis of ester group of **10** to **11** does not occur because

of the resonance-stabilization by the lone pair electrons on the methylthio sulfur atom. Eventually, under the reaction conditions in the Entry 4, **10** was obtained in 70% yield. In contrast, under such milder conditions as refluxing in MeOH for 2 h, **4a** and **4b** reacted with 15% aqueous NaSMe to give brassicanal $A^{8a,b}$ (**12**) and 2-methylthio-3-acetylindole⁶ (**13**) in quantitative yields, respectively.

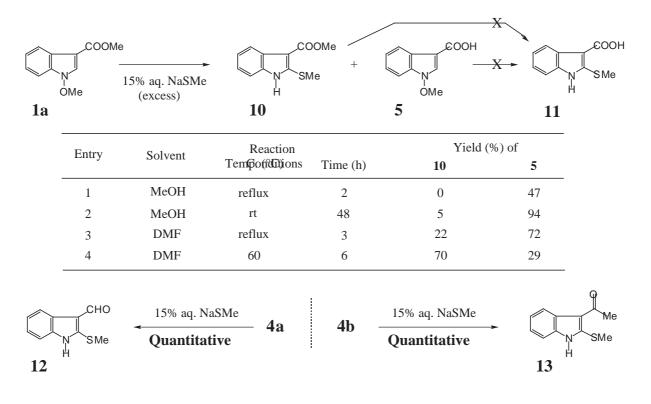

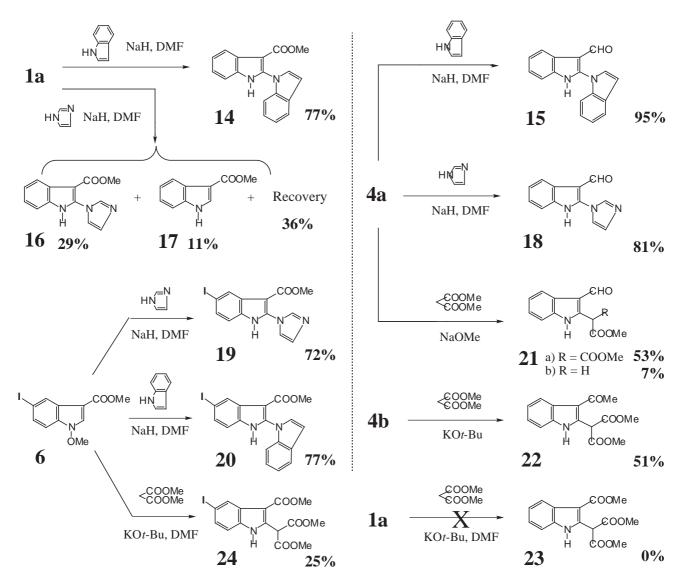

Table 1

The reaction of **1a** with sodium indolyl in DMF at room temperature afforded methyl 2-(indol-1-yl)indole-3-carboxylate (**14**) in 77% yield, while the similar reaction of **4a** provided 2-(indol-1-yl)indole-3carbaldehyde⁵ (**15**) in 95% yield (Scheme 2). Sodium imidazolyl reacted with **1a** in DMF at 60°C to afford methyl 2-(imidazol-1-yl)indole-3-carboxylate (**16**), methyl indole-3-carboxylate (**17**) and unreacted **1a** in 28, 11, and 36% yields, respectively. The corresponding reaction of **4a** with sodium imidazolyl provided 2-(imidazol-1-yl)indole-3-carbaldehyde⁵ (**18**) in 81% yield even at room temperature.

Remarkable enhancement in the reactivity of the nucleophilic substitution was observed by the introduction of halogen onto the indole ring. Thus, methyl 2-(imidazol-1-yl)-5-iodoindole-3-carboxylate (**19**) was produced in 72% yield in the reaction of **6** with sodium imidazolyl in DMF at 60°C, in contrast to the yield of 28% in the case of **16** as described above. In the reaction of **6** with the most reactive sodium indolyl, the yield (77%) of methyl 2-(indol-1-yl)-5-iodoindole-3-carboxylate (**20**) was almost the same as that of the corresponding reaction of **1a**.

As reported in the previous papers, 6,11 sodium dimethylmalonate reacted smoothly with **4a** and **4b** giving **21a**, **b** and **22**, respectively. On the other hand, the reaction of **1a** with sodium dimethylmalonate did not form the desired **23** under various examined conditions, while similar KO*t*-Bu promoted reaction of **6** provided **24** in 25% yield.

Scheme 2

In conclusion, we succeeded in establishing a simple five steps synthetic method for **1a** from **2**. Utilizing the route, **1a** and **5** were obtained in pure state for the first time. Regioselective preparation of 5-iodo derivative (6) was also successful. After examining some nucleophilic substitution reactions of 1-methoxyindoles reported in this paper, we have found the order of relative reactivity as 5 < 1a < 6 < 4b < 4a, which correlates with the electron withdrawing ability of the 3-substituent. Comparisons of these reactivities and antifungal activities are now in progress.

EXPERIMENTAL

Melting points were determined on a Yanagimoto micro melting point apparatus and are uncorrected. IR spectra were determined with a Shimadzu IR-420 spectrophotometer, and ¹H-NMR spectra with either a JEOL JNM FX100S or JEOL GSX-500 spectrometer with tetramethylsilane as an internal standard. MS spectra were recorded on a JEOL SX-102A spectrometer. Column chromatography was performed on silica gel (SiO₂, 100-200 mesh, from Kanto Chemical Co. Inc.). Preparative thin-layer chromatography

(p-TLC) was performed on Merck Kiesel-gel GF₂₅₄ (Type 60)(SiO₂).

1-Methoxyindole-3-carboxylic acid (5) from 1-Methoxyindole-3-carbaldehyde (4a) — A solution of NaClO₂ (5.233 g, 57.86 mmol) and NaH₂PO₄• 2H₂O (6.770 g, 43.40 mmol) in H₂O (30.0 mL) was added to a solution of 4a (507 mg, 2.89 mmol) in *t*-BuOH (30.0 mL) and 2-methyl-2-butene (30.0 mL) at 0°C and the mixture was stirred for 39 h at rt. After addition of H₂O, the whole was extracted with CHCl₃–MeOH (95:5, v/v). The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave a solid, which was column-chromatographed on SiO₂ with CHCl₃ to give 5 (523 mg, 95%). 5: mp 173—174°C (colorless prisms, recrystallized from AcOEthexane). IR (KBr): 2910 (br), 1664, 1512, 1450, 1325, 1265, 1220, 1085, 1010, 945, 740, 729, 716, 623 cm⁻¹. ¹H-NMR (CDCl₃) δ : 4.18 (3H, s), 7.31 (1H, dt, *J*=1.1, 7.6 Hz), 7.34 (1H, dt, *J*=1.1, 7.6 Hz), 7.49 (1H, dt, *J*=7.6, 1.1 Hz), 8.06 (1H, s), 8.24 (1H, dt, *J*=7.6, 1.1 Hz). MS *m/z*: 191 (M⁺). *Anal.* Calcd for C₁₀H₉NO: C, 62.82; H, 4.75; N, 7.33. Found: C, 62.69; H, 4.75; N, 7.21.

Methyl 1-Methoxyindole-3-carboxylate (1a) from 5 — A solution of diazomethane in ether (30.0 mL) was added dropwise to a solution of 5 (252 mg, 1.32 mmol) in MeOH (8.0 mL) and the mixture was stirred for 1 h at rt. The solvent was evaporated under reduced pressure to leave an oil, which was column-chromatographed on SiO₂ with CHCl₃–MeOH (99:1, v/v) to give **1a** (268 mg, 99%). **1a**: mp 45—46°C (colorless prisms, recrystallized from CHCl₃). IR (film): 3125, 2990, 1700 (br), 1520, 1490, 1455, 1440, 1375, 1330, 1260, 1210, 1150, 1120, 1088, 1027, 961, 775, 750, 730 cm⁻¹. ¹H-NMR (CDCl₃) δ : 3.91 (3H, s), 4.15 (3H, s),7.28 (1H, dt, *J*=1, 7.8 Hz), 7.32 (1H, dt, *J*=1, 7.8 Hz), 7.46 (1H, dt, *J*=7.8, 1 Hz), 7.96 (1H, s), 8.17 (1H, dt, *J*=7.8, 1 Hz). High-resolution MS *m/z*: Calcd for C₁₁H₁₁NO₃: 205.0742. Found: 205.0739.

Methyl 5-Iodo-1-methoxyindole-3-carboxylate (6) from 1a — KI (607 mg, 3.66 mmol) and NaIO₄ (783 mg, 3.65 mmol) were added to a solution of 1a (150 mg, 0.73 mmol) in TFA (4.0 mL) and H₂O (1.0 mL) and the mixture was stirred for 24 h at rt. After addition of ice and H₂O, the whole was extracted with CHCl₃–MeOH (9:1, v/v). The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on SiO₂ with CHCl₃ to give **6** (166 mg, 69%). **6**: pale yellow gum. IR (KBr): 1708, 1523, 1453, 1361, 1205, 1084 cm⁻¹. ¹H-NMR (CDCl₃) δ : 3.91 (3H, s), 4.13 (3H, s), 7.24 (1H, dd, *J*=8.8, 0.7 Hz), 7.58 (1H, brd, *J*=8.8 Hz), 7.90 (1H, s), 8.52 (1H, brs). High-resolution MS *m/z*: Calcd for C₁₁H₁₀NO₃I: 330.9707. Found: 330.9705.

Methyl 5-Iodo- (7), 6-Iodo- (8), and 7-Iodoindole-3-carboxylate (9) from Methyl indole-3-carboxylate (1b) — KI (1.700 g, 10.2 mmol) and NaIO₄ (2.192 g, 10.2 mmol) were added to a solution of 1b (300 mg, 1.72 mmol) in TFA (8 mL) and H₂O (3 mL) and the mixture was stirred for 48h at 20°C. After addition of ice and H₂O, the whole was extracted with CHCl₃–MeOH (9:1, v/v). The extract was washed successively with aq. 10% sodium thiosulfate and brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave solid, which was repeatedly column-chromatographed on SiO₂ with AcOEt-hexane (1:4—2:3, v/v) to give 9 (11 mg, 2%), 8 (131 mg, 25%), and 7 (300 mg, 58%) in the order of elution. 7: mp 243.0—243.5°C (colorless prisms, recrystallized from MeOH). IR (KBr): 3200, 1676, 1525, 1442, 1192, 1175 cm⁻¹. ¹H-NMR (CDCl₃–CD₃OD, 1:1) δ : 3.89 (3H, s), 7.16 (1H,

d, J=8.5 Hz), 7.48 (1H, dd, J=8.5, 2 Hz), 7.84 (1H, s), 8.44 (1H, d, J=2 Hz). MS m/z: 301 (M⁺). Anal. Calcd for C₁₀H₈NO₂I: C, 39.88; H, 2.67; N, 4.65. Methyl 2-Methylthioindole-3-carboxylate (10) from 1a — Excess 15% aqueous sodium thiomethoxide (9.0 mL) was added to a solution of 1a (62 mg, 0.30 mmol) in DMF (3.0 mL) and the mixture was stirred for 6 h at 60°C. After addition of H₂O, the whole was made acidic by adding aqueous 1N HCl with ice-cooling and extracted with AcOEt. The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on SiO₂ with CHCl₃–MeOH (99:1, v/v) to give 10 (47 mg, 70%) and 5 (17 mg, 29%) in the order of elution. 10: mp 105—107°C (colorless fine needles, recrystallized from CHCl₃–hexane). IR (KBr): 3300, 1660 (br), 1450, 1200, 1068, 758 cm⁻¹. ¹H-NMR (CDCl₃) δ : 2.63 (3H, s), 3.96 (3H, s), 7.18 (1H, t, *J*=7.8 Hz), 7.22 (1H, t, *J*=7.8 Hz), 7.32 (1H, d, *J*=7.8 Hz), 8.03 (1H, d, *J*=7.8 Hz), 8.45 (1H, br s). MS *m*/*z*: 221 (M⁺). *Anal.* Calcd for C₁₁H₁₁NO₂S• 1/2H₂O: C, 57.39; H, 5.21; N, 6.08. Found: C, 57.65; H, 5.02; N, 5.96.

Methyl 2-(Indol-1-yl)indole-3-carboxylate (14) from 1a — A solution of indole (19 mg, 0.16 mmol) in anhydrous DMF (2.0 mL) was added to 60% NaH (4.8 mg, 0.12 mmol) with ice-cooling and the mixture was stirred for 15 min at rt. To the resultant solution, a solution of 1a (17 mg, 0.08 mmol) in anhydrous DMF (1.0 mL) was added and the mixture was stirred for 16 h at rt. After addition of H₂O, the whole was extracted with AcOEt. The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on SiO₂ with CHCl₃–hexane (1:1, v/v) to give 14 (18 mg, 77%). 14: mp 159—160°C (colorless prisms, recrystallized from CHCl₃–hexane). IR (KBr): 3210, 1658, 1560, 1465, 1442, 1204, 1141, 1090 cm⁻¹. ¹H- NMR (CDCl₃) δ : 3.76 (3H, s), 6.72 (1H, dd, *J*=3.4, 0.7 Hz), 7.20 (1H, dt, *J*=1.7, 7.1 Hz), 7.24 (1H, dt, *J*=1.7, 7.1 Hz), 7.33—7.36 (2H, m), 7.37—7.40 (2H, m), 7.43 (1H, d, *J*=3.4 Hz), 7.68 (1H, dd, *J*=7.1, 1.7 Hz), 8.24 —8.26 (1H, m), 8.71 (1H, br s, disappeared on addition of D₂O). MS *m/z*: 290 (M⁺). *Anal.* Calcd for C₁₈H₁₄N₂O₂• 1/3H₂O: C, 72.97; H, 4.95; N,9.46. Found: C, 72.74; H, 4.84; N, 9.41.

Methyl 2-(Imidazol-1-yl)indole-3-carboxylate (16) from 1a — A solution of imidazole (80 mg, 1.17 mmol) in anhydrous DMF (2.0 mL) was added to 60% NaH (21 mg, 0.88 mmol) with icecooling and the mixture was stirred for 15 min at rt. To the resultant solution, a solution of 1a (60 mg, 0.29 mmol) in anhydrous DMF (3.0 mL) was added and the mixture was stirred for 25 h at 60°C. After addition of H₂O, the whole was extracted with AcOEt. The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave a solid, which was recrystallized from MeOH to give **16** (15 mg). Mother liquor was subjected to p-TLC on SiO₂ with CHCl₃–MeOH (95:5, v/v) as a developing solvent. Under UV light, theree bands were detected. Extraction of the band (*Rf* value: 0.96–0.80) with CHCl₃–MeOH (9:1, v/v) afforded unreacted **1a** (21 mg, 36%). Extraction with the same solvent as above, 5.6 mg (11%) of **1b** was obtained from the band (*Rf* value: 0.68–0.50). Similarly, further crop of **16** (5 mg) was obtained from the band (*Rf* value: 0.29–0.18). Total yield of **16** was 20 mg (28%). **16**: mp 265–266°C (colorless needles, recrystallized from MeOH). IR (KBr): 1691, 1460, 1345, 1215, 1060, 745, 720 cm⁻¹. ¹H-NMR (DMSO-*d*₆) δ : 3.75 (3H, s), 7.11 (1H, s), 7.24 (1H, dt, *J*=1.2, 7.3 Hz), 7.27 (1H, dt, *J*=1.2, 7.3 Hz), 7.44 (1H, dt, *J*=1.2, 7.3 Hz), 7.60 (1H, t, *J*=1.2 Hz), 8.04 (1H, dt, *J*=7.3, 1.2 Hz), 8.11 (1H, s). MS *m/z*: 241 (M⁺). *Anal.* Calcd for C₁₃H₁₁N₃O₂: C, 64.72; H, 4.60; N, 17.42. Found: C, 64.59; H, 4.60; N, 17.29.

Methyl 2-(Imidazol-1-yl)-5-iodoindole-3-carboxylate(19) from 6 — A solution of imidazole (34 mg, 0.51 mmol) in anhydrous DMF (1.0 mL) was added to 60% NaH (15 mg, 0.38 mmol) with ice-cooling and the mixture was stirred for 10 min at rt. To the resultant solution, a solution of 6 (42 mg, 0.12 mmol) in anhydrous DMF (2.0 mL) was added and the mixture was stirred for 23 h at 62°C. After addition of H₂O, the whole was extracted with AcOEt. The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave a solid, which was column-chromatographed on SiO₂ with AcOEt–hexane (2:1, v/v) to give 19 (36 mg, 72%). 19: mp 271—272°C (colorless prisms, recrystallized from MeOH). IR (KBr): 1692, 1490, 1441, 1218, 1161, 1062 cm⁻¹. ¹H-NMR (DMSO-*d*₆) δ : 3.76 (3H, s), 7.11 (1H, s), 7.30 (1H, d, *J*=8.5 Hz), 7.54 (1H, dd, *J*=8.5, 1.7 Hz), 7.61 (1H, br s), 8.12 (1H, s), 8.29 (1H, s, disappeared on addition of D₂O), 8.35 (1H, d, *J*=1.7 Hz). MS *m/z*: 367 (M⁺). *Anal.* Calcd for C₁₃H₁₀N₃O₂I: C, 42.52; H, 2.73; N, 11.44. Found: C, 42.38; H, 2.76; N,11.16.

Methyl 2-(Indol-1-yl)-5-iodoindole-3-carboxylate (20) from 6 — A solution of indole (18 mg, 0.15 mmol) in anhydrous DMF (2.0 mL) was added to 60% NaH (4.7 mg, 0.12 mmol) with icecooling and the mixture was stirred for 15 min at rt. To the resultant solution, a solution of 6 (26 mg, 0.08 mmol) in anhydrous DMF (1.5 mL) was added and the mixture was stirred for 17.5 h at rt. After addition of H₂O, the whole was extracted with AcOEt. The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave an oil, which was column-chromatographed on SiO₂ with CHCl₃-hexane (2:1, v/v) to give 20 (25 mg, 77%). 20: mp 192—194°C (colorless prisms, recrystallized from CHCl₃-hexane). IR (KBr): 1668, 1558, 1273, 1204, 1144 cm⁻¹. ¹H-NMR (CDCl₃) δ : 3.78 (3H, s), 6.72 (1H, d, *J*=3.4 Hz), 7.16 (1H, d, *J*=8.6 Hz), 7.22 (1H, dt, *J*=1.7, 7.1 Hz), 7.25 (1H, dt, *J*=1.7, 8.1 Hz), 7.37 (1H, d, *J*=8.1 Hz), 7.43 (1H, d, *J*=3.4 Hz), 7.60 (1H, dd, *J*=8.6, 1.7 Hz), 7.68 (1H, dd, *J*=8.1, 1.7 Hz), 8.59 (1H, d, *J*=1.7 Hz), 8.83 (1H, s, disappeared on addition of D₂O). MS *m/z*: 416 (M⁺). *Anal*. Calcd for C₁₈H₁₃N₂O₂I· 1/2H₂O: C, 50.84; H, 3.29; N,6.59. Found: C, 50.80; H, 3.04; N, 6.46.

Dimethyl 2-(5-Iodo-3-methoxycarbonylindol-2-yl)malonate (24) from 6 — A solution of dimethyl malonate (96 mg, 0.72 mmol) in anhydrous DMF (8.0 mL) was added to KO*t*-Bu (81 mg, 0.72 mmol) and the mixture was stirred for 10 min at rt. To the resultant solution, a solution of **6** (60 mg, 0.18 mmol) in anhydrous DMF (4.0 mL) was added and the mixture was stirred for 9 h at 72°C. After addition

of H₂O and ice, the whole was extracted with AcOEt–MeOH (95:5, v/v). The extract was washed with brine, dried over Na₂SO₄, and evaporated under reduced pressure to leave an oil, which was subjected to p-TLC on SiO₂ with CHCl₃–hexane (4:1, v/v) as a developing solvent. Extraction of the band (*Rf* value: 0.87–0.65) with CHCl₃ gave unreacted **6** (24 mg, 40%). Extraction of the band (*Rf* value: 0.45–0.23) with CHCl₃ gave **24** (20 mg, 25%). **24**: mp 159–160°C (colorless prisms, recrystallized from CHCl₃–hexane). IR (KBr): 1729 (br), 1691, 1436, 1260, 1085, 1023 cm⁻¹. ¹H-NMR (CDCl₃) δ : 3.81 (6H, s), 3.96 (3H, s), 6.23 (1H, s), 7.20 (1H, d, *J*=8.6 Hz), 7.54 (1H, dd, *J*=8.6, 1.7 Hz), 8.46 (1H, d, *J*=1.7 Hz), 9.70 (1H, brs). High-resolution MS *m/z*: Calcd for C₁₅H₁₄NO₆I: 430.9860. Found: 430.9866.

REFERENCES AND NOTES
