

2001, Volume 40

Timo Hatanpää,* Jarno Kansikas, Ilpo Mutikainen, and Markku Leskelä: Ancillary Ligand Effect on the Properties of “Mg(thd)₂” and Crystal Structures of [Mg(thd)₂(ethylenediamine)]₂, [Mg(thd)₂(tmeda)], and [Mg(thd)₂(trien)].

Page 788: At the end of the third paragraph it is written, “In some cases, though without success, a β -diketonato⁷ or β -ketoiminate ligand itself has been functionalized with side chains containing donor atoms.” However, it is clearly inappropriate to say “without success” in the case of β -ketoiminates. The sentence mentioned above should be replaced by the following:

“In some cases a β -diketonate⁷ or β -ketoiminate⁸ ligand itself has been functionalized with side chains containing donor atoms. The results with β -diketonato complexes have not been very encouraging, while results with the β -ketoiminato complexes have been successful.”

The authors sincerely apologize to Professor T. J. Marks and co-workers for referring inaccurately to their work.
