### Nitrogen-15-Labeled Complexes of $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2$

S. Pell, R. H. Mann, H. Taube, and J. N. Armor\*

Received May 22, 1973

Although the positions of the bands in the infrared spectrum of  $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2$  have been reported in detail,<sup>1</sup> only brief references<sup>2,3</sup> have been made to the exact positions of some of the dinitrogen-labeled complexes. Several years ago,<sup>4</sup> we began to compile data on the dinitrogen-28 and -29 complexes. Only recently, we have developed an efficient method for preparing pure samples of the dinitrogen-29 complex.<sup>5</sup> In the course of our work, we also prepared the dinitrogen-30 sample for another investigator. Quinby and Feltham<sup>6</sup> recently published estimates for the dinitrogen bands in  $\text{Ru-}^{14}\text{N-}^{15}\text{N}$  and  $\text{Ru-}^{15}\text{N-}^{14}\text{N}$  based upon curve resolution of our earlier data. We now have a complete set of more accurate results. While their conclusions do not need to be altered, the actual positions of the bands are sufficiently shifted to warrant a further report. In addition, a complete description of the dinitrogen bands in the infrared spectrum of  $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2$  (when  $\text{N}_2$  is 28, 29, or 30) will be presented. We believe that such a compilation will prove useful for future investigators seeking to assess the exact origin of the transitions and pursuing the mechanistic details of other dinitrogen formation reactions

### Experimental Section

$[\text{Ru}(\text{NH}_3)_5^{28}\text{N}_2]\text{Br}_2$  was prepared by any one of several synthetic procedures.<sup>1,5,7,8</sup>  $[\text{Ru}(\text{NH}_3)_5^{29}\text{N}_2]\text{Br}_2$  was prepared by reaction of  $\text{Cr}^{2+}$  with  $\text{Ru}(\text{NH}_3)_5\text{N}_2\text{O}^{2+}$  with the  $\text{N}_2\text{O}$  labeled in either the endo or exo positions ( $^{15}\text{N-N-O}$  or  $\text{N-}^{15}\text{N-O}$ ). Alternatively, the treatment of alkaline solutions of  $\text{Ru}(\text{NH}_3)_6^{3+}$  with  $^{15}\text{NO}$  also results in the formation of the  $^{29}\text{N}_2$  complex.<sup>5</sup>  $[\text{Ru}(\text{NH}_3)_5^{30}\text{N}_2]\text{Br}_2$  was prepared by  $\text{Cr}^{2+}$  reduction of  $[\text{Ru}(\text{NH}_3)_5^{15}\text{N-}^{15}\text{N-O}]^{2+}$ . The latter was formed in solution upon the treatment of  $\text{Ru}(\text{NH}_3)_5\text{OH}_2^{2+}$  with  $^{15}\text{N-}^{15}\text{N-O}$ .<sup>8</sup> All compounds were checked for their purity using the  $\lambda_m$  at 221 nm,

$\epsilon$   $1.8 \times 10^4 \text{ M}^{-1} \text{ cm}^{-1}$ . Of the compounds described above, only the  $[\text{Ru}(\text{NH}_3)_5^{30}\text{N}_2]\text{Br}_2$  displayed a significant impurity (and it was the  $[\text{Ru}(\text{NH}_3)_5\text{Br}]\text{Br}_2$  complex (~17%).

Ir spectra in the range  $4000\text{--}250 \text{ cm}^{-1}$  were recorded as Nujol mulls on KBr plates using a Perkin-Elmer 180 ir spectrometer. A few room-temperature spectra were recorded using KBr disks. The  $2180\text{-cm}^{-1}$  region was calibrated using atmospheric  $\text{CO}_2$  ( $2350 \text{ cm}^{-1}$ ). The  $500\text{-cm}^{-1}$  region was calibrated using atmospheric water vapor.<sup>9</sup> Low-temperature spectra were obtained by mounting the KBr plates (~30 mg of Ru complex, 2 drops Nujol) against a copper cold finger filled with liquid nitrogen. This unit was placed inside a glass sleeve through which cold, dry nitrogen was purged. The flow of cold nitrogen over the faces of the KBr disks prevented the formation of significant amounts of ice on the faces of the disk. The glass sleeve was clamped into position in the sample beam and encased within a large plastic sheet taped to the instrument. Reproducible low-temperature spectra were obtained within 3 min after pouring liquid nitrogen into the copper cold finger.

### Results and Discussion

The data in Table I summarize the dinitrogen frequencies for the four possible isomers obtained using  $^{14}\text{N}$  and  $^{15}\text{N}$  sources of nitrogen. The values for  $^{14}\text{N-}^{15}\text{N}$  and  $^{15}\text{N-}^{14}\text{N}$  frequencies are based upon equilibrated samples of  $^{14}\text{N-}^{15}\text{N}$  or  $^{15}\text{N-}^{14}\text{N}$  (prepared *via* the appropriately labeled samples of the nitrous oxide complexes). In addition, the value for the  $^{14}\text{N-}^{15}\text{N}$  frequency has been confirmed by the direct reaction of  $^{15}\text{NO}$  with the coordinated ammine.<sup>5</sup> While the definition of the bands varied as a function of the preparation, the apparent increase in intensity and sharpening of the bands at low temperature did provide an opportunity to assign the bands in Table I. On lowering the temperature, all the bands for  $\delta_{\text{Ru-N}_2}$  were shifted  $\sim 4 \text{ cm}^{-1}$  toward higher energy.

When one allows for the affect of counterion<sup>10</sup> on the exact positions of dinitrogen frequencies in the ir spectrum, our values are found to be internally consistent with previously published values in the  $2100\text{-cm}^{-1}$  region.<sup>2,3</sup> Shifts on the order of  $\Delta\nu \sim 70 \text{ cm}^{-1}$  for  $\text{Ru}^{28}\text{N}_2$  vs.  $\text{Ru-}^{30}\text{N}_2$  have been reported in the past.<sup>11-13</sup> However, one report<sup>2</sup> claims that  $\text{Ru-}^{14}\text{N-}^{15}\text{N}$  absorbs at  $2098 \text{ cm}^{-1}$  (as the  $\text{I}^-$  salt), while  $\text{Ru-}^{15}\text{N-}^{14}\text{N}$  absorbs at  $2094 \text{ cm}^{-1}$ . Within the resolution afforded by our instruments in this spectral region, we did not observe any splitting of equilibrated mixtures of the  $\text{Br}^-$  salts for  $\text{Ru-}^{14}\text{N-}^{15}\text{N}$  or  $\text{Ru-}^{15}\text{N-}^{14}\text{N}$  in Nujol mulls. In addition, KBr disks of our  $\text{Ru-}^{29}\text{N}_2$  samples demonstrated no discernible

**Table I.** Positions of the Dinitrogen Infrared Bands in  $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2^a$ 

Ru-N-N	$\delta_{\text{Ru-N}_2}$ ( $\pm 1 \text{ cm}^{-1}$ )			$\nu_{\text{N}_2}$ ( $\pm 5 \text{ cm}^{-1}$ )	
	Obsd (low temp)	Obsd (room temp)	Calcd <sup>b</sup> (room temp)	Obsd (room temp)	Calcd <sup>b</sup> (room temp)
$\text{Ru-}^{14}\text{N-}^{14}\text{N}$	511	508	507.7	2105	2106.7
$\text{Ru-}^{14}\text{N-}^{15}\text{N}$	505	501	502.7	2070	2071.4
$\text{Ru-}^{15}\text{N-}^{14}\text{N}$	499	496	495.9	2070	2071.4
$\text{Ru-}^{15}\text{N-}^{15}\text{N}$	495	492	490.7	2040	2035.5

<sup>a</sup> Nujol mulls. <sup>b</sup> The force constants obtained from the calculation are  $k_{\text{NN}} = 18.298 \pm 0.061 \text{ mdyn/\AA}$  and  $H_\delta = 0.788 \pm 0.008 \text{ mdyn/\AA}$ .

splitting of the band at  $2075 \pm 0.5 \text{ cm}^{-1}$ . The maximum separation of possible, unresolved bands under this envelope at  $2075 \text{ cm}^{-1}$  is  $\pm 3 \text{ cm}^{-1}$ .

Our observations have recently been confirmed by Quinby and Feltham.<sup>6</sup> In addition, they reported only a small splitting of  $\nu_{\text{N}_2}$  in only one salt ( $\text{SbF}_6^-$ ) of *trans*- $[\text{RuCl}(\text{N}^{15}\text{N-}^{14}\text{N})(\text{das})_2]^+$  ( $2094$  and  $2089 \text{ cm}^{-1}$ ). In all other salts only a single  $\nu_{\text{N}_2}$  frequency was observed, and in no case was a splitting in  $\nu_{\text{RuN}_2}$  at  $446.5 \text{ cm}^{-1}$  observed. However there was a splitting of the degenerate bending frequency  $\delta_{\text{RuN}_2}$  near  $490 \text{ cm}^{-1}$  for almost every salt. They concluded that shifts for  $\nu_{\text{Ru}^{14}\text{N}^{15}\text{N}}$  and  $\nu_{\text{Ru}^{15}\text{N}^{14}\text{N}}$  could only be  $\sim 1 \text{ cm}^{-1}$ ; however, in order to explain the shifts of  $\sim 9 \text{ cm}^{-1}$  which we observed for the band at  $508 \text{ cm}^{-1}$  in  $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2$ , they suggested that the band at  $508 \text{ cm}^{-1}$ , previously assigned<sup>1,2</sup> as  $\nu_{\text{RuN}_2}$ , be reassigned as  $\delta_{\text{RuN}_2}$ . More importantly, they concluded that the assignment of the  $508\text{-cm}^{-1}$  band to  $\nu_{\text{RuN}_2}$  would require an observed shift of  $\sim 9 \text{ cm}^{-1}$  for this band and should demand a corresponding shift of  $\sim 35 \text{ cm}^{-1}$  for  $\nu_{\text{N}_2}$ . No bands of significant intensity were observed for  $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2$  which could be assigned to  $\nu_{\text{RuN}_2}$ . In addition, they reported that they were unable to see any splitting of the  $2070\text{-cm}^{-1}$   $[\text{Ru}(\text{NH}_3)_5\text{N}_2]\text{Br}_2$  bands (to better than  $5 \text{ cm}^{-1}$ ).

No bands of significant intensity were observed for the  $\text{Br}^-$  salt that could be attributed to  $\nu_{\text{RuN}_2}$ . (The  $\text{I}^-$  salt has been reported<sup>2</sup> to display a band at  $516 \text{ cm}^{-1}$ .) Examination of the infrared (at a readout of  $1 \text{ cm}^{-1}/\text{division}$ ) spectrum to  $400 \text{ cm}^{-1}$  indicated no change in any of the other band positions (at  $466$ ,  $448$ ,  $440$ , and  $430 \text{ cm}^{-1}$ ) upon  $^{15}\text{N}$  substitution. To confirm the assignments of the  $\delta_{\text{RuN}_2}$  bands near  $500 \text{ cm}^{-1}$  and the  $\nu_{\text{N-N}}$  bands in the  $2100\text{-cm}^{-1}$  region, a simple normal-coordinate calculation was made (using the programs of Schachtschneider<sup>14</sup> as modified by Mann<sup>15</sup>) involving the linear triatomic system Ru-N-N. The bond distances were obtained from the work of Bottomley and Nyburg.<sup>16</sup> Since no data were available for  $\nu_{\text{Ru-N}}$ , it was impossible to obtain a complete set ( $k_{\text{N-N}}$ , N-N stretch;  $k_{\text{Ru-N}}$ , Ru-N stretch;  $H_\delta$ , Ru-N-N bend;  $k_{\text{Ru-N,N-N}}$ , the stretch-stretch interaction term) of force constants for this model. However, by performing a preliminary calculation, using as starting guesses the force constants obtained in the work of Feltham,<sup>6</sup> the assignment of the bands for the four isomers became readily apparent: three bands were predicted for the  $\nu_{\text{N-N}}$  region, two for the  $\nu_{\text{Ru-N}}$  region, and four for  $\delta_{\text{Ru-N-N}}$ . The force constants  $k_{\text{N-N}}$  and  $H_\delta$  were then allowed to refine, and the results obtained are displayed

in Table I. It can be seen that regardless of the value of the bending force constant  $H_\delta$ , the  $\delta_{\text{Ru-N}_2}$  frequencies will always be in the following order:  $\text{Ru-}^{14}\text{N-}^{14}\text{N} > \text{Ru-}^{14}\text{N-}^{15}\text{N} > \text{Ru-}^{15}\text{N-}^{14}\text{N} > \text{Ru-}^{15}\text{N-}^{15}\text{N}$ . By using the central atom as a point of reference, one might have anticipated the bending mode for  $\text{Ru-}^{15}\text{N-}^{14}\text{N}$  to be more like that for  $\text{Ru-}^{14}\text{N-}^{14}\text{N}$  than that for  $\text{Ru-}^{15}\text{N-}^{15}\text{N}$ . Since this would have given rise to a set of frequencies different from those observed, this assumption is not correct. It is further seen that, to the extent to which the triatomic model is valid, only two bands will occur in the  $\nu_{\text{Ru-N}}$  region (one for the two  $\text{Ru-}^{14}\text{N}$  isomers and one for the two  $\text{Ru-}^{15}\text{N}$  molecules) and three in the  $\nu_{\text{N-N}}$  region, with coincident frequencies for the two  $\text{Ru-}^{29}\text{N}_2$   $\nu_{\text{NN}}$  stretches. In order to validate this assignment, the value of the stretch-stretch interaction term  $k_{\text{Ru-N,N-N}}$  was arbitrarily assigned inordinately large values. The resulting calculation yielded no further splitting of the bands.

In conclusion we have presented the complete description of the observed bending and stretching modes for the four isomers of  $[\text{Ru}(\text{NH}_3)_5^{28,29,30}\text{N}_2]\text{Br}_2$ . No splitting is observed for  $\nu_{\text{N}_2}$  in the  $^{29}\text{N}_2$  isomer, while a significant splitting is observed for  $\delta_{\text{Ru-N}_2}$  in the same isomer. The latter is very useful in identifying<sup>5,8,17</sup> the products of dinitrogen formation reactions. The relative energies of the observed bands for  $\delta_{\text{Ru-N}_2}$  can be correctly assigned by considering the isotopic shifts expected for a stretching mode of Ru-N. Using the data presented, the conclusions of Feltham regarding the reassignment of  $\nu_{\text{Ru-N}_2}$  and  $\delta_{\text{Ru-N}_2}$  have been confirmed.

**Acknowledgment.** We wish to express our thanks for the sample of nitrous oxide ( $^{15}\text{N-}^{15}\text{N-O}$ ) provided by Professor Roberts. The work was supported in part by the donors of the Petroleum Research Fund, administered by the American Chemical Society.
