#### Abstract

Reductive dimerization of dodecylthio substituted 1,2-dithiole-3-thiones 6a-b and trithion-dithiacrown ethers 10a-c with triethyl phosphite furnished bis- and tetrakis (dodecylthio), and bis(dithiacrown ether) substituted thiodes-

aurines $(E)$ - $\mathbf{1 1 \mathbf { a } - \mathbf { b } \text { and } ( E ) - \mathbf { 1 2 a } - \mathbf { c } \text { . The stereochemistry of } \mathrm { f }}$ bis(dithia[15]crown-5)-thiodesaurine ( $E$ )-12b has been determined by X-ray crystallographic analysis.

2,4-Bis-(2-oxo-ethylidene)-1,3-dithietane derivatives are well known as desaurines [1-3]. Thioxo-analogous desaurines which we would like to call thiodesaurines were unknown, until some years ago. Mollier et al. showed that 5-methylthio substituted 1,2-dithiole-3-thiones with trimethyl phosphite dimerize to yield 1,3-dithietane-2,4-diylidene-bis(methyldithioacetate) derivatives [4]. Desulfurization of 4,5-bis(methylthio)-1,2-dithiole-3-thione (1) with trimethyl phosphite in refluxing benzene furnished the thiodesaurine 2,4 -bis(3-thioxo-2,5-dithiahex4 -ylidene)-1,3-dithietane (2) (Scheme 1). Thiodesaurine 2 was produced, as a mixture of its geometrical isomers ( $E$ )-2 and (Z)-2 [4].

Scheme 1 Dimerization of 4,5-bis(methylthio)-1,2-dithiole-3-thione (1) [4]; ${ }^{\text {a }}$ ) Present work, reaction with $\mathrm{P}(\mathrm{OEt})_{3}$ in $p$-xylene at $130^{\circ} \mathrm{C}$

Recently, we repeated the synthesis of 2 with triethyl phosphite in $p$-xylene, at $130^{\circ} \mathrm{C}$, and noticed comparable results (Scheme 1). The stereochemistry of ( $E$ )-2 could be confirmed by X-ray crystallographic analysis [5]. ( $E$ )-2 is an almost complete planar molecule. Only the methyl groups of the methylthio substituents at the C,C-double bonds are orientated approximately orthogonal to the molecule plane (compare stereo formula of ( $E$ )-2 in Scheme 1). In an effort to use the plane $(E)$-thiodesaurine unit for new liquid crystalline compounds, we synthesized bis- and tetrakis(dodecylthio) substituted ( $E$ )-thiodesaurines. These molecules comprise a nearly flat sulphur-rich core connected with two and four long chain substituents. The tetrakis(dodecylthio) substituted ( $E$ )-thiodesaurine could be a new disc-shaped molecule [6]. In addition, we are interested in the complexing properties of thiodesaurines which could be useful as preorganized polydentate sulfur ligands. The tetrakis(methylthio) substituted thiodesaurines ( $E$ )-2 and (Z)-2 are not particularly useful for metal-complexation studies because they are only sparingly soluble in most solvents. Therefore, the chromatographical separation of $(E)-\mathbf{2}$ and $(Z)$ 2 is very time and material consuming. That's why we are looking for derivatives of 4,5-dithio-1,2-dithiole-3-thiones which permit the stereoselective synthesis of $(E)$ - and ( $Z$ )-thiodesaurines and increase the solubility of thiodesaurines. Here, we wish to report the dimerization of dodecyl and of crowned 4,5 -dithio-1,2-dithi-ole-3-thione derivatives by triethyl phosphite in $p$-xylene in high yields to well soluble ( $E$ )-thiodesaurines.

## Results and Discussion

4-Dodecylthio-5-methylthio- and 4,5-bis(dodecylthio)-1,2-dithiole-3-thione (6a) and ( $\mathbf{6 b}$ ), and trithion-di-thia[18]crown-6 (10c) were prepared from 4,5-bis(ben-zoylthio)-1,2-dithiole-3-thione [7] (3), as shown in Scheme 2. For the synthesis of the unsymmetrically substituted 1,2-dithiole-3-thione 6a 4-benzoylthio-5-meth-ylthio-1,2-dithiole-3-thione (4) [7] was saponified to the thiolate 5 and then alkylated. The symmetrically substituted 1,2-dithiole-3-thione $6 \mathbf{b}$ could be prepared by alkylation of dithiolate 7 [7]. 10c was synthesized by the method we recently used for the preparation of trithion-dithia[12]crown-4 (10a) and trithion-dithia-[15]crown-5 (10b) [8]. Cyclization of dimercaptane 8 [7] with dibromide 9 , in DMF, using caesium carbonate as base and high dilution, yielded $\mathbf{1 0 c}$.

Schema 2 Synthesis of dodecylthio substituted 1,2-dithiole-3-thiones 6a-b and trithion-dithia[18]crown-6 (10c),
${ }^{\text {a }}$ ) Steimecke et al. [7]

Reaction of dodecylthio substituted 1,2-dithiole-3thiones $\mathbf{6 a - b}$ and trithion-dithiacrown ethers $10 \mathbf{a}-\mathbf{c}$ with five to six equiv. triethyl phosphite in $p$-xylene, at $130^{\circ} \mathrm{C}$, furnished, in any case, one dimerization product (Scheme 3). They were identified as thiodesaurines by the three characteristic ${ }^{13} \mathrm{C}$ NMR signals of the thio-

Fig. 1 Molecular structure of bis(dithia[15]crown-5)-thiodesaurine ( $E$ )-12b in the crystal is shown in two different views, above: vertical and below: parallel to the ( $E$ )-thio-desaurine unit
desaurine unit. Table 1 compares the corresponding ${ }^{13} \mathrm{C}$ NMR data of $(E)-2$ and ( $Z$ )-2 with those of bis- and tetrakis(dodecylthio) substituted thiodesaurines $(E)$ -11a-b and bis(dithiacrown ether)thiodesaurines ( $E$ )-12a-c. ( $E$ )- and ( $Z$ )-2 can be distinguished by their IR spectra [4]. The IR spectrum of the centrosymmetrical ( $E$ ) $\mathbf{- 2}$ shows fewer bands than that of its $(Z)$-isomer. Comparison of IR spectra of $(E)-11 \mathbf{a}-\mathbf{b}$ with that of ( $E$ ) $\mathbf{2}$ allows us to assume that dodecylthio substituted thiodesaurines exhibit ( $E$ )-stereochemistry. The stereochemistry of the bis(dithia[15]crown-5)-thiodesaurine ( $E$ )-12b has been determined by X-ray crystallographic analysis. As Figure 1 shows, both thioxo-dithiacrown ether rings are $(E)$-configurated with respect to the 2,4 -dimethylidene-1,3-dithietane unit. We conclude that the bis (dithiacrown ether)-thiodesaurines 12a and c are ( $E$ )-configurated, too, since their IR spectra are comparable with the spectrum of $(E)$ - $\mathbf{1 2 b}$.
The bond lengths and angles of the ( $E$ )-thiodesaurin unit in $(E)-\mathbf{1 2 b}$ are comparable with those in $(E)-2$ [5]. As already observed for $(E) \mathbf{- 2}$, in $(E)-\mathbf{1 2 b}$ the eight sulfur and the six central carbon atoms lie almost in a plane. In contrast, to the reductive dimerization of 4,5 -bis (methylthio)-1,2-dithiole-3-thione (1) with triethyl phosphite which leads to an $(E) /(Z)$-thiodesaurine mixture, the dimerizations of dodecyl and crowned 4,5-dithio-1,2-dithiole-3-thiones derivatives, exclusively, yielded the ( $E$ )-isomers. These results could be explained by the greater sterical demand of the substituents in $(E)$ -11a-b and ( $E$ )-12a-c, compared to those in 2 which should be better fulfilled in the $(E)$ - than in the ( $Z$ )thiodesaurines. For generalizing this assumption other 4,5-dithio-1,2-dithiole-3-thione derivatives than $\mathbf{1}$ which also have substituents with little steric demand as 9 -thioxo-2,5,7,8-tetrathiabicyclo[4.3.0]non-1-en [9] and 10-thioxo-2,6,8,9-tetrathiabicyclo[5.3.0]-dec-1-en [9] with triethyl phosphite were reduced, however thiodesaurines were not formed. Instead mixtures of up to now unidentified products with smaller molecular masses than the expected thiodesaurines were isolated.

The thermal behaviour of bis(dodecylthio) and tetrakis(dodecylthio) thiodesaurine ( $E$ )-11a-b were investigated by polarising microscopy. Unfortunately, these compounds showed no liquid crystalline (mesogenic) properties.
S. Rudershausen thanks the Bundesland MecklenburgVorpommern for a graduate stipendium. The author thanks M. Pötter for polarising microscopy investigations.

## Experimental

All experiments were carried out under an atmosphere of dry, pure argon. Standard equipment was used throughout the experiments. Solvents were dried by conventional methods.

4,5-Bis(benzoylthio)-1,2-dithiole-3-thione (3) was synthesized according to Jakisch et al. [10]; disodium 1,2-dithiole-3-thione-4,5-dithiolate (7), 4,5-dimercapto-1,2-dithiole-3-thione (8) and 4-benzoylthio-5-methylthio-1,2-dithiole-3-thione (4) according to Steimecke et al. [7]. Trithion-dithia[12]crown-4 (10a) and trithion-dithia[15]crown-5 (10b) were prepared as recently reported [8].
Melting points: not corrected, hot-stage microscope. - IR: Nicolet 205 ET-IR. - UV/Vis: SPECORD M40 (Carl Zeiss Jena). - ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR: Bruker ARX 300. - MS: Finnigan MAT. - CC: Merck silica gel 60, 63-200 $\mu \mathrm{m}$. TLC: Merck silica gel 60 . - The thermal behaviour of the thiodesaurines 11a-b was investigated by polarising microscope (LEITZ, Laborlux 12 POL with Mettler heating stage FP 90) with rates of two $\mathrm{K} / \mathrm{min}$ for heating and cooling.

## Sodium 5-methylthio-1,2-dithiole-3-thione-4-thiolate (5)

To a suspension of 4-benzoylthio-5-methylthio-1,2-dithiole-3-thione (4) ( $0.4 \mathrm{~g} ; 1.27 \mathrm{mmol}$ ) in methanol ( 4 ml ), sodium ( $0.03 \mathrm{~g} ; 1.3 \mathrm{mmol}$ ) in methanol ( 7 ml ) was added. The reaction mixture was stirred at room temperature for 30 min and then filtered into 80 ml of diethylether. The red sodium salt crystallized at $6^{\circ} \mathrm{C}$. Yield $0.26 \mathrm{~g}(87 \%)$ of red crystals. - IR (KBr): $\mathrm{v} / \mathrm{cm}^{-1}=2970(\mathrm{w}), 2924(\mathrm{w}), 2902(\mathrm{~m}), 1414(\mathrm{w})$, 1363 (s), 1247 (s), 1230 (s), 1055 (w), 975 (w), 933 (m), 836 (m), $730(\mathrm{w}), 667(\mathrm{w}) . \mathrm{-}^{1} \mathrm{H}$ NMR $\left(\mathrm{CH}_{3} \mathrm{OD}\right): \delta / \mathrm{ppm}=2.76$ $\left(\mathrm{s}, 3 \mathrm{H}, \mathrm{SCH}_{3}\right) .-{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CH}_{3} \mathrm{OD}\right): \delta / \mathrm{ppm}=14.38\left(\mathrm{SCH}_{3}\right)$, 151.52 (C-4), 166.52 (C-5), 207.18 (C=S).

## Crystal Structure Determination of Bis(dithia[15]crown-5)-thiodesaurine (E)-12b [12]

STOE-IPDS, $\mathrm{Mo}_{\mathrm{K} \alpha}$-Radiation ( $\lambda=71.073 \mathrm{pm}$ ), room temperature; The structure was solved by direct methods (XS program for crystal structure solution, version 4.2 für MSDOS, Copyright Siemens Analytical Xray Inst. Inc.) and refined by full-matrix least-squares method of (SHELXL-93) [11]. All nonhydrogen atoms were refined anisotropically (except the disordered O21/O21'). The hydrogen atoms were placed into theoretical positions and refined by using the riding model. Crystal Structure Data: $\mathrm{C}_{22} \mathrm{H}_{32} \mathrm{O}_{6} \mathrm{~S}_{8}, \quad M=648.97$ $\mathrm{g} \mathrm{mol}^{-1}$, Crystal size: $0.40 \times 0.10 \times 0.08 \mathrm{~mm}^{3}$, mono-clinic, Space group $P 2(1) / \mathrm{c}, \mathrm{Z}=4, \mathrm{a}=1061.1$ (2), $\mathrm{b}=1487.2$ (3), c $=1853.3(4) \mathrm{pm}, \beta=97.81(3)^{\circ}, \mathrm{V}=2.897(1) \mathrm{nm}^{3}, \mathrm{~d}_{\mathrm{c}}=1.488$ $\mathrm{Mg} / \mathrm{m}^{3}, \mathrm{~F}(000)=1360, \mu=0.65 \mathrm{~mm}^{-1}, 5855$ reflections
collected in the scan range of $3.52^{\circ} \leq 2 \Theta \leq 44.00^{\circ}, 3398$ independent reflections, 1811 observed reflections, R1 (2 $\sigma(\mathrm{I})$ ) $=0.0472, \mathrm{R} 1$ (all data) $=0.0988, \mathrm{wR} 2$ (all data) $=0.01445$, GooF $=1.058$ for 325 Parameter and 4 Restraints, Weighting scheme: $\omega=1 /\left[\sigma^{2}\left(\mathrm{Fo}^{2}\right)+(0.0662 \mathrm{P})^{2}+0.0000 \mathrm{P}\right]$ with $\mathrm{P}=$ $\left(\mathrm{Fo}^{2}+2 \mathrm{Fc}^{2}\right) / 3$. The asymmetric unit comprises two halfmolecules, thus forming a unit cell with two slightly different molecules.
