Abstract. A convenient partial synthesis of the lactone (+)10 is reported starting from the readily available methyl ( $S$ )-(+)-3-hydroxy-2-methylpropanoate (+)-1. Furthermore, an
efficient three step route to the optically active saturated isoprene unit (-)-13 in high yield starting from the lactone (+)10 is reported for the first time.

During our investigations on the enantioselective total synthesis of labdane diterpenes [1,2] we required the optically active saturated isoprene building block $(-)-\mathbf{1 3}$. This compound can readily be prepared starting from the $(R)$-enantiomer of the $\beta$-substituted $\gamma$-butyrolactone (+)-10 adopting a convenient three step sequence developed by Schmid and Barner [3, 4].

While the ( $S$ )-(-)-enantiomer of lactone $\mathbf{1 0}$ is commercially available (Fluka Chemie AG, Buchs, Switzerland), no effective method for the preparation of the corresponding $(R)$ -$(+)$-enantiomer has been reported, although $(R)-(+)-\mathbf{1 0}$ is known to be a useful chiral synthon for the synthesis of different natural products like mammalian dolichols [5] or various labdane diterpenes $[1,2,6,7,8]$. There is only reported the resolution of the racemic lactone $( \pm)-\mathbf{1 0}$ with $(R)-(+)-\alpha-$ phenylethylamine as the chiral auxiliary $[1,5]$ using the method of Helmchen and Nill [9] and a multistep asymmetric total synthesis starting from $(E)-(2 R, 3 S)$-6-ethylidene-3,4-dimethyl-2-phenylperhydro-1,4-oxazepine-5,7-dione for the preparation of $(R)-(+)-\mathbf{1 0}[10,11] .(S)-(-)-10$ was synthesized by Mori [12] starting from methyl $(R)-(-)-3$-hydroxy-2methylpropanoate $((-)-\mathbf{1})$ in five steps with a total yield of $17 \%$.

In this communication we report a convenient partial synthesis of (+)-10 starting from commercial methyl (S)-(+)-3-hydroxy-2-methylpropanoate ((+)-1), Fluka Chemie AG, Buchs, Switzerland) with a total yield up to $49 \%$. Furthermore, an efficient three step route to the optically active saturated isoprene unit (-)-13 in high yield starting from the lactone $(+)-10$ is reported for the first time.

To avoid by-products it was necessary to protect the hydroxy group of the starting compound (+)-1 as its MOMor TBDMS-ether (+)-2 and (+)-3, respectively. (+)-2 and (+)3 can be transferred by means of $\mathrm{LiAlH}_{4}$ reduction to the corresponding alcohols (+)-4 and (+)-5. In order to receive a better leaving group for the next step of the synthesis, alcohols (+)4 and $(+)-5$ were treated with $p$-tosyl chloride in pyridine yielding the tosylates (+)-6 and (+)-7. Introduction of a cyano group extended the carbon chain for one unit affording the

nitriles $(+)-\mathbf{8}$ and ( + )-9 in almost quantitative yield. Finally cyclization of (+)-8 and (+)-9 under acidic conditions afforded lactone (+)-10 in very good overall yield (up to 49\%).

The synthesis of the optically active saturated isoprene building block (-)-13 was achieved by transesterification of lactone (+)-10 with 8 m HBr in ethanol leading to the $\gamma$ bromoester $(+)$ - $\mathbf{1 1}$. DIBAH-reduction of $(+)-\mathbf{1 1}$ and protection of the hydroxy group of the resulting alcohol ( - )-12 as TBDMS ether afforded the side chain building block (-)-13, synthesized for the first time and in high overall yield.

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were taken on a Bruker AC 300 spectrometer. Chemical shifts are given in ppm ( $\delta$-scale), coupling constants ( $J$ ) in Hertz. ${ }^{1} \mathrm{H}$-chemical shifts ( 300 MHz ) were referenced to the residual $\mathrm{CHCl}_{3}$ signal (7.24). ${ }^{13} \mathrm{C}$-chemical shifts ( 75 MHz ) were referenced to $\mathrm{CDCl}_{3}$ (77.0). MS were recorded at 70 eV on a Varian MAT-313 spectrometer. Optical rotations were measured on a Perkin Elmer 241 polarimeter. IR-spectra were taken on a Perkin Elmer 1420 ratio recording spectrometer, $1-2 \%$ solution in $\mathrm{CHCl}_{3}$.

Thin layer chromatography was carried out on precoated plates of Polygram ${ }^{\circledR}$ SILG/UV 254 (layer thickness 0.25 mm , Macherey-Nagel). Spots were visualized by UV ( 254 nm ) and spraying with phosphomolybdic acid reagent followed by heating to about $200{ }^{\circ} \mathrm{C}$. MPLC was performed on Merck silica gel 60 (70-230 mesh ASTM).

Methyl (S)-(+)-3-hydroxy-2-methylpropanoate was purchased from Fluka Chemie AG (Buchs, Switzerland). All reactions were carried out under nitrogen. Solvents were distilled under nitrogen before use: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{CHCl}_{3}$ from $\mathrm{P}_{2} \mathrm{O}_{5}$, ether from $\mathrm{Na} /$ benzophenone.

Preparation of 8 m HBr in EtOH: Bromine was slowly added to a stirred mixture of tetrahydronaphthalene (dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and distilled) and some Fe-shavings (as catalyst) at r.t. The resulting HBr gas was bubbled through tetrahydronaphthalene and a gas trap (cooled to $-60^{\circ} \mathrm{C}$ ) to remove rests of bromine and tetrahydronaphthalene. The purified HBr gas was bubbled through anhydrous ethanol ( 100 g ), until the mass increased about 65 g . The resulting solution can be stored at $-20^{\circ} \mathrm{C}$ for several weeks under exclusion of moisture.

## Methyl (S)-(+)-2-methyl-3-methoxymethyloxypropanoate (+)-2

$7.10 \mathrm{~g}(50 \mathrm{mmol}) \mathrm{P}_{2} \mathrm{O}_{5}$ was added to a mixture of 5.33 g $(45.1 \mathrm{mmol})$ of methyl ( $S$ )-(+)-3-hydroxy-2-methylpropanoate $((+)-\mathbf{1})$ and $34.25 \mathrm{~g}(450 \mathrm{mmol})$ methylal in 100 ml of $\mathrm{CHCl}_{3}$.

The mixture was stirred overnight at r.t. The solution was decanted. 100 ml of $\mathrm{CHCl}_{3}$ and some crushed ice were added to the residue, and the mixture was neutralized with $2 \mathrm{~N} \mathrm{~K}_{2} \mathrm{CO}_{3}$ solution. The organic phase was separated, and the aqueous layer was extracted twice with 50 ml of $\mathrm{CHCl}_{3}$. The organic phase was washed with $\mathrm{NaHCO}_{3}$ aq, water and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to give $6.14 \mathrm{~g}(37.9 \mathrm{mmol}$, $84 \%)$ of (+)-2 as a colourless oil. $R_{\mathrm{f}}=0.56$ (cyclohexane/ EtOAc, $2: 1) .[\alpha]_{\mathrm{D}}^{25}=+11.9^{\circ}\left(\mathrm{c}=1.03, \mathrm{CHCl}_{3}\right) .-\mathrm{IR}: v / \mathrm{cm}^{-1}$ = 2950, 2880, 1730, 1460, 1440, 1390, 1140, 1110, 1040. ${ }^{1} \mathrm{H}$ NMR: $\delta / \mathrm{ppm}=2.65(\mathrm{~m}, \mathrm{H}-2), 3.55(\mathrm{~m}, 2 \mathrm{H}-3), 1.08(\mathrm{~d}, J$ $=7.1,3 \mathrm{H}-4), 3.59\left(\mathrm{~s}, \mathrm{CH}_{3} \mathrm{O}\right), 4.50\left(\mathrm{~s}, \mathrm{CH}_{3} \mathrm{OCH}_{2}\right), 3.23(\mathrm{~s}$, $\left.\mathrm{CH}_{3} \mathrm{OCH}_{2}\right) .-{ }^{13} \mathrm{C}$ NMR: $\delta / \mathrm{ppm}=174.9(\mathrm{C}-1), 40.0(\mathrm{C}-2)$, $69.4(\mathrm{C}-3), 13.7(\mathrm{C}-4), 51.5\left(\mathrm{CH}_{3} \mathrm{O}\right), 96.3\left(\mathrm{CH}_{3} \mathrm{OCH}_{2}\right), 55.0$ $\left(\mathrm{CH}_{3} \mathrm{OCH}_{2}\right) .-\mathrm{MS}: m / z(\%)=147(10)\left[\mathrm{M}^{+}-15\right], 131(7), 103$ (11), 69 (100), 45 (10).

5.36 g ( 45.1 mmol ) methyl ( $S$ )-(+)-3-hydroxy-2-methylpropanoate ( $(+)-1)$ was added to a solution of $6.13 \mathrm{~g}(90 \mathrm{mmol})$ imidazole and $10.2 \mathrm{~g}(67.7 \mathrm{mmol})$ of TBDMSCl in 100 ml of $\mathrm{N}, \mathrm{N}$-dimethylformamide. ## (R)-(+)-2-Methyl-3-methoxymethyloxypropan-1-ol (+)-4

A solution of $4.90 \mathrm{~g}(30.2 \mathrm{mmol})(+)-2$ in anhydrous ether $(25 \mathrm{ml})$ was added dropwise to a stirred suspension of $\mathrm{LiAlH}_{4}$ $(750 \mathrm{mg})$ in anhydrous ether ( 25 ml ) at $0-5^{\circ} \mathrm{C}$. The stirring was continued for 4 h at r.t. The excess of $\mathrm{LiAlH}_{4}$ was destroyed by successive careful addition of water ( 10 ml ) and $10 \% \mathrm{KOH}$ aq ( 2 ml ) to the stirred mixture. After stirring for 2 h the suspension was filtered, and the solid was washed three times with 25 ml of ether. The combined filtrates and washings were washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to give $3.20 \mathrm{~g}(23.9 \mathrm{mmol}, 79 \%)$ of $(+)-4 . The combined organic phases were washed with $5 \% \mathrm{KHCO}_{3}-$ solution and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to yield $1.24 \mathrm{~g}(12.4 \mathrm{mmol}, 93 \%)$ of $(+) \mathbf{- 1 0}$ as a colourless liquid.
B: Cyclization of (+)-9
Compound (+)-10 was synthesized as described under A starting from $1.82 \mathrm{~g}(8.53 \mathrm{mmol})(+)-9$. After work up the reaction yielded $512 \mathrm{mg}(5.12 \mathrm{mmol}, 60 \%)$ of $(+)-10$ as a colourless oil. $R_{\mathrm{f}}=0.59$ (cyclohexane/EtOAc, 1:1). $[\alpha]_{\mathrm{D}}^{25}=$ $+23^{\circ}(\mathrm{c}=4.00, \mathrm{MeOH})[5][\alpha]_{\mathrm{D}}^{26}=+25.7^{\circ}(\mathrm{c}=4.0, \mathrm{MeOH})$. - IR: $\mathrm{v} / \mathrm{cm}^{-1}=2996,2990,1779,1365,1170,1020 .-{ }^{1} \mathrm{H}$ NMR: $\delta / \mathrm{ppm}=2.01(\mathrm{~m}, \mathrm{H}-3), 2.46(\mathrm{~m}, \mathrm{H}-3), 2.52(\mathrm{~m}, \mathrm{H}-4)$, 3.71 (m, H-5), 4.25 (m, H-5), 1.11 (d, $J=5.9,3 \mathrm{H}-6)$. ${ }^{13} \mathrm{C}$ NMR: $\delta / \mathrm{ppm}=177.0(\mathrm{C}-2), 35.7(\mathrm{C}-3), 30.0(\mathrm{C}-4), 74.4$ $(\mathrm{C}-5), 17.5(\mathrm{C}-6) .-\mathrm{MS}: m / z(\%)=100(21)\left[\mathrm{M}^{+}\right], 56(69), 42$ (100), 41 (87).

## Ethyl (R)-(+)-4-Bromo-3-methylbutanoate (+)-11

$1.06 \mathrm{~g}(10.6 \mathrm{mmol})(+)-\mathbf{1 0}$ was added dropwise to a solution of 8 m HBr in anhydrous ethanol $(15 \mathrm{ml})$ at r.t. After the
addition was complete, the mixture was stirred for 16 h at r.t. The reaction mixture was poured onto ice, and, after addition of water ( 50 ml ), extracted with ether $(3 \times 25 \mathrm{ml})$. The combined organic layers were washed successively with $\mathrm{NaHCO}_{3}$ solution and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and the solvent was evaporated in vacuo at r.t. to afford $2.13 \mathrm{~g}(10.2 \mathrm{mmol}, 96 \%)$ of $(+)-11$ as a colourless liquid. $R_{\mathrm{f}}=0.55$ (cyclohexane/EtOAc, $8: 1) .[\alpha]_{\mathrm{D}}^{25}=+2.8^{\circ}\left(\mathrm{c}=4.34, \mathrm{CHCl}_{3}\right)[3](-)-11[\alpha]_{\mathrm{D}}^{26}=-2.3^{\circ}$ $\left(\mathrm{c}=4.0, \mathrm{CHCl}_{3}\right) .-\mathrm{IR}: v / \mathrm{cm}^{-1}=2960,2925,2875,1715$, 1450, 1370, 1290, 1135, 1020. $-{ }^{1} \mathrm{H}$ NMR: $\delta / \mathrm{ppm}=2.16-$ 2.51 (m, 2H-2), 2.28 (m, H-3), 3.39 (m, 2H-4), 1.03 (d, $J=$ $6.6,3 \mathrm{H}-5), 4.09\left(\mathrm{q}, J=7.1,\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 1.21(\mathrm{t}, J=7.1\right.$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right) .-{ }^{13} \mathrm{C}$ NMR: $\delta / \mathrm{ppm}=171.9(\mathrm{C}-1), 39.2(\mathrm{C}-2)$, $32.0(\mathrm{C}-3), 40.0(\mathrm{C}-4), 18.6(\mathrm{C}-5), 60.3\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 14.0$ $\left(\mathrm{OCH}_{2} \mathrm{CH}_{3}\right) .-\mathrm{MS}: m / z(\%)=165 / 163(16 / 15), 137 / 135(6 /$ 5), 129 (8), 88 (100), 60 (30), 55 (46), 41 (35).

## R-(-)-4-Bromo-3-methyl-1-butanol (-)-12

To 25 ml of a solution of 1 m DIBAH in hexane was added dropwise (+)-11 ( $2.43 \mathrm{~g}, 11.6 \mathrm{mmol}$ ) in hexane $(10 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$. After the addition was complete, the mixture was allowed to stand at $-20^{\circ} \mathrm{C}$ for 12 h . Excessive DIBAH was destroyed by adding MeOH at $0^{\circ} \mathrm{C}$, and then the mixture was poured onto ice. The mixture was treated with $2 \mathrm{~N} \mathrm{H}_{2} \mathrm{SO}_{4}$ until pH 3 4 was reached, and extracted with ether $(3 \times 25 \mathrm{ml})$. The combined organic layers were washed successively with $5 \%$ aqueous $\mathrm{NaHCO}_{3}$ solution ( 20 ml ) and brine ( 20 ml ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and the solvent was evaporated in vacuo at r.t. to give $1.87 \mathrm{~g}(11.3 \mathrm{mmol}, 96 \%)$ of ( - )-12 as a pale yellow liquid. $R_{\mathrm{f}}=0.42$ (cyclohexane/EtOAc, 1:1). $[\alpha]_{\mathrm{D}}^{25}=-2.5^{\circ}(\mathrm{c}=2.75$, $\mathrm{CHCl}_{3}$ ). - IR: $v / \mathrm{cm}^{-1}=3400,2960,2940,2855,1465,1380$, 1275, 1235, 1093, 725. - ${ }^{1} \mathrm{H}$ NMR: $\delta / \mathrm{ppm}=3.70(\mathrm{~m}, 2 \mathrm{H}-1)$, 1.45 (m, H-2), 1.69 (m, H-2), 1.99 (m, H-3), 3.36 ( $J=5.1$, $1.1,2 \mathrm{H}-4), 1.01$ (d, $J=6.7,3 \mathrm{H}-5), 2.44$ (br.s, OH). ${ }^{13} \mathrm{C}$ NMR: $\delta / \mathrm{ppm}=58.9(\mathrm{C}-1), 37.1(\mathrm{C}-2), 31.6(\mathrm{C}-3), 41.2$ (C-4), $18.5(\mathrm{C}-5) .-\mathrm{MS}: m / z(\%)=150 / 148$ (9/8), 122/120 (30/31), 69 (91), 56 (52), 41 (100).
